## FEATURES

RS-232 Compatible
Operates with 3 V or 5 V Logic
Ultralow Power CMOS: 1.3 mA Operation
Low Power Shutdown: $0.2 \mu \mathrm{~A}$
Suitable for Serial Port Mice
116 kbits/s Data Rate
$1 \mu \mathrm{~F}$ Charge Pump Capacitors
Single +3 V to +3.6 V Power Supply
Two Receivers Active in Shutdown (ADM560)

## APPLICATIONS

Laptop Computers
Palmtop Computers
Notebook Computers
Peripherals
Modems
Printers
Battery Operated Equipment

## GENERAL DESCRIPTION

The ADM560/ADM561 are four driver/five receiver interface devices designed to meet the EIA-232 standard while operating with a single +3.3 V power supply. The devices feature an onboard dc-to-dc converter, eliminating the need for dual $\pm 5 \mathrm{~V}$ power supplies. This dc-dc converter contains a voltage doubler and voltage inverter which internally generates $\pm 6.6 \mathrm{~V}$ from the input +3.3 V power supply.
The ADM560 and ADM561 consume only 5 mW making them ideally suited for battery and other power-sensitive applications. A shutdown facility is also provided which reduces the power to $0.66 \mu \mathrm{~W}$.
The ADM560 contains active low shutdown and active high receiver enable signals. In shutdown mode, two receivers remain active thereby allowing monitoring of peripheral devices. This feature allows the device to be shut down until a peripheral device begins communication. The active receivers can alert the processor which can then take the ADM560 out of the shutdown mode.

The ADM561 features active high shutdown and an active low receiver enable. In this device all receivers are disabled in shutdown.

The ADM560/ADM561 is fabricated using CMOS technology for minimal power consumption. It features a high level of overvoltage protection and latch-up immunity. The receiver inputs

can withstand up to $\pm 25 \mathrm{~V}$ levels. The transmitter inputs can be driven from either 3 V or 5 V logic levels. This allows operation in mixed $3 \mathrm{~V} / 5 \mathrm{~V}$ power supply systems.
The ADM560/ADM561 is packaged in a 28 -pin SO and a 28-pin SSOP package.

## ORDERING GUIDE

| Model | Temperature Range | Package Option |
| :--- | :--- | :--- |
| ADM560JR | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | $\mathrm{R}-28$ |

## ADM560/ADM561

## GENERAL DESCRIPTION

The ADM560/ADM561 are RS-232 transmission line drivers/ receivers which operate from a single +3.3 V supply. This is achieved by integrating step up voltage converters and level shifting transmitters and receivers onto the same chip. CMOS technology is used to keep the power dissipation to an absolute minimum. The ADM560/ADM561 is a modification, enhancement and improvement to the AD230-AD241 family and derivatives thereof. It is essentially plug-in compatible and does not have materially different applications.
The ADM560/ADM561 contains an internal voltage doubler and a voltage inverter which generates $\pm 6.6 \mathrm{~V}$ from the +3.3 V input. Four external $1 \mu \mathrm{~F}$ capacitors are required for the internal voltage converter.

## CIRCUIT DESCRIPTION

The internal circuitry consists of three main sections. These are:

1. A charge pump voltage converter
2. 3 V Logic to EIA-232 transmitters
3. EIA-232 to 3 V Logic receivers.

## Charge Pump DC-DC Voltage Converter

The Charge Pump Voltage converter consists of an oscillator and a switching matrix. The converter generates a $\pm 6.6 \mathrm{~V}$ supply from the input +3.3 V level. This is done in two stages using a switched capacitor technique as illustrated below. First, the 3.3 V input supply is doubled to 6.6 V using capacitor C 1 as the charge storage element. The 6.6 V level is then inverted to generate -6.6 V using C 2 as the storage element.
Capacitors C3 and C4 are used to reduce the output ripple. Their values are not critical and can be reduced if higher levels of ripple are acceptable. The charge pump capacitors C1 and C 2 may also be reduced at the expense of higher output impedance on the $\mathrm{V}+$ and V - supplies.
The $\mathrm{V}+$ and V - supplies may also be used to power external circuitry if the current requirements are small.

## Transmitter (Driver) Section

The Drivers convert 3 V or 5 V logic input levels into EIA-232 output levels. With $\mathrm{V}_{\mathrm{CC}}=+3.3 \mathrm{~V}$ and driving an EIA-232 load, the output voltage swing is typically $\pm 5.5 \mathrm{~V}$.

Figure 1. Charge Pump Voltage Doubler

Figure 2. Charge Pump Voltage Inverter
Unused inputs may be left unconnected, as an internal $400 \mathrm{k} \Omega$ pull-up resistor pulls them high forcing the outputs into a low state. The input pull-up resistors typically source $8 \mu \mathrm{~A}$ when grounded so unused inputs should either be connected to $\mathrm{V}_{\mathrm{CC}}$ or left unconnected in order to minimize power consumption.

## Receiver Section

The receivers are inverting level shifters which accept EIA-232 input levels and translate them into 3 V logic output levels. The inputs have internal $5 \mathrm{k} \Omega$ pull-down resistors to ground and are also protected against overvoltages of up to $\pm 25 \mathrm{~V}$. The guaranteed switching thresholds are 0.4 V minimum and 2.4 V maximum. Unconnected inputs are pulled to 0 V by the internal $5 \mathrm{k} \Omega$ pull-down resistor. This, therefore, results in a Logic 1 output level for unconnected inputs or for inputs connected to GND.
The receivers have schmitt trigger input with a hysteresis level of 0.3 V . This ensures error-free reception for both noisy inputs and for inputs with slow transition times.

## ENABLE AND SHUTDOWN

Table I shows the truth table for the enable and shutdown control signals. When disabled, all receivers are placed in a high impedance state. In shutdown, all transmitters are disabled and all receivers on the ADM561 are disabled. On the ADM560, receivers R 4 and R 5 remain enabled in shutdown.
