## 9- and 11-Channel, Muxed Input LCD Reference Drivers

## AD8509/AD8511

FEATURES
Single-Supply Operation: 3.3 V to 5 V
High Output Current: $\mathbf{3 0 0} \mathbf{~ m A}$
Low Supply Current: 6 mA
Stable with 1000 pF Loads
Pin Compatible with LMC6009
Pin Compatible with CL-FP6131

## APPLICATIONS

## LCD Driver

## GENERAL DESCRIPTION

The AD 8509 is a 9-channel (AD 8511 an 11-channel) LCD reference driver designed to drive 64 gray scale column drivers. Each buffer has an A/B input used to select between two voltages for LCD displays. These buffers are used to drive the resistor ladders of LCD column drivers for gamma correction.
These LCD drivers have higher slew rates and output drive current than similar competitive parts. This increases the stability of the reference ladder, resulting in better gray scale and visual performance.
The AD 8509 and AD8511 are specified over the $-20^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range. They are available in 48 -lead thin shrink small outline (TSSOP) surface mount packages in tape and reel.

## CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD 8509/AD 8511 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. T herefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## AD8509/AD8511

## APPLICATIONS

The AD 8509 and AD 8511 are CM OS buffers with A/B inputs, which are used to select between two different reference voltages set up by an external resistor ladder. Input bias currents are orders of magnitude less than competitive parts, allowing very large resistor ladders to be used to save supply current. A guaranteed value of 50 nA is much higher than actual values and is limited by leakage in the test system.
Buffer outputs are designed to drive resistive loads. They are also stable with capacitive loads, so no resistors should be used in series with these outputs to attain the best display performance. Outputs have high slew rates and $6 \mu$ settling times. Each output is capable of delivering a minimum of 120 mA , assuring fast response to varying loads.

The AD 8509 is a 9-channel buffer and is similar to the LM C 6009 in functionality. The AD8511 is an 11-channel buffer similar to the CL-FP6131. H owever, the control to select either 9- or 11-channel operation, the EN _11 pin of the CL-FP6131, is not available on the AD 8511. If 9-channel operation is desired, use the AD 8509.
Power supply pins on the AD 8509 and AD 8511 have multiple ground and $\mathrm{V}_{\mathrm{CC}}$ connections. Because of the high peak currents that these buffers can deliver, it is strongly recommended that all be connected, and that the $\mathrm{V}_{\mathrm{Cc}}$ pins be suitably bypassed.
