

## TMXF84622 155 Mbits/s/622 Mbits/s Interface SONET/SDH x84/x63 Ultramapper

### 1 Features

- Versatile IC supports 622 Mbits/s/155 Mbits/s SONET/SDH interface solutions for T3/E3, DS2, T1/E1/J1, and DS0/E0/J0 applications.
- Implementation supports both linear (1 + 1, unprotected) and ring (UPSR) network topologies.
- Provides full termination of up to 63 (21 x 3) E1, 84 (28 x 3) T1, or 84 (28 x 3) J1.
- Low 3.3 V power supply.
- -40 °C to +85 °C industrial temperature range.
- 700-pin ball grid array (PBGA) package.
- Complies with *Telecordia Technologies*<sup>\*</sup>, ITU, ANS/†, ETSI, and Japanese TTC standards: GR-253-CORE, GR-499, (ATT) TR-62411, ITU-T G.707, G.704, G.706, G.783, G.962, G.964, G.965, Q.542, T1.105, JT-G704, JT-G706, JT-G707, JT-I431-a, ETS 300 417-1-1, ETS 300 011, T1.107, T1.404.

### SONET/SDH Interface

- Termination of a single 622 Mbits/s STS-12/STM-4 or single 155 Mbits/s STS-3/STM-1.
- Built-in clock and data recovery circuit at 622 Mbits/s STS-12/STM-4 interface.
- Supports overhead processing for all transport and path overhead bytes.
- Optional insertion and extraction of overhead bytes via a serial transport overhead access channel. Configurable as dedicated DCC channels.
- Software controlled linear 1 + 1 protection via dedicated interface to protection card.
- Full path termination and SPE extraction/insertion.
- SONET/SDH compliant condition and alarm reporting.
- Built-in diagnostic loopback modes.
- 8 kHz line frame synchronizing output.

### PDH Interfaces

- 6 DS3, 21 x DS2, or 6 E3, 12 x E2.
- Twenty-one framed or unframed DS1 or E1 interfaces.
- Two additional protection channels for DS2/DS1/E1.

### STS/STM Pointer Interpreter

- Interprets STS/AU/TU-3 pointers.
- Synchronizes 8 kHz frame and 2 kHz superframe to system-shelf-timing reference by setting the transmit STS-3/STM-1 pointers to a fixed value of 522 with an adjustable frame location.
- Monitors/terminates SPE path overhead.

### STS3 Serial Interconnect

- Serial interface to mate devices.
- 4 Ultramapper devices, 3 configured as mate devices, provide full termination of an STS-12/STM-4. A 4 chip solution to terminate 336 DS1s/J1s or 252 E1s.

### VT Termination/Generation 84/63 (3x28/21)

- Supports TIM-V generation and termination for all 84/63 (3x28/21) VT/TU signals.
- Synchronizes VT/TU SPE to system-shelf-timing reference by setting the transmit VT/TU pointers to fixed values for asynchronous mapping or by dynamically changing the transmit VT/TU pointers for byte synchronous mapping.
- Fixed pointer generation in transmit side for asynchronous mapping.
- Dynamic pointer generation in transmit side for byte-synchronous mapping.

† *ANSI* is a registered trademark of American National Standards Institute, Inc.

## Features (continued)

### Mapping/Multiplexing Modes 84/63 (3x28/21)

- Maps DS3 clear channel or framed signal into STS-1 or TUG-3.
- Maps T1/E1/J1 into VT/TU structures.
- Maps T1 into VT1.5/TU-11/TU-12.
- Maps J1 into VT1.5/TU-11/TU-12.
- Maps E1 into VT2/TU-12.
- Supports asynchronous, byte-synchronous, and bit-synchronous mapping.
- Supports UPSR applications via the dedicated ring interface and an external tributary selector.
- Supports all valid T1/E1/J1 multiplexing structures into STS-1 and STS-3/STM-1.
- STS-3/STS-1/SPE/VTG/VTx.
- STM-1/AU-3/TUG-2/TU-1x/VC-1x.
- STM-1/AU-4/TUG-3/TUG-2/TU-1x/VC-1x.
- Allows grooming of VTs/TUs in granularity of TUG-2s within the STS-3/STM-1 signal.
- Supports J2 trace identifier monitoring/insertion.
- Configurable VT/TU slot selection for DS1, E1, J1 insertion and drop.
- Automatic receive monitor functions include VT/TU RDI-V, REI-V, BIP-2 errors, AIS-V, LOP-V.
- Complies with GR-253-CORE, GR-499, ITU-T G.707, G.704, G.783, T1.105, JT-G707, ETS 300 417-1-1.

### M13 Features (3)

- Configurable multiplexer/demultiplexer for 28 DS1 signals, 21 E1 signals, or 7 DS2 signals to/from a DS3 signal.
- Operates in either M23 or C-bit parity mode.
- Provisionable time-slot selection for DS1, E1, and DS2 insertion or drop.
- Full alarm monitoring and generation (LOS, BPV, EXZ, OOF, SEF, AIS, RAI, FEAC, P-bit and C-bit parity errors, FEBE).
- HDLC transmitter with 128-byte data buffer and HDLC receiver with 128-byte data FIFO for the C-bit parity path maintenance data link.
- DS3, DS2, DS1, and E1 loopback and loopback request generation.
- Complies with T1.102, T1.107, T1.231, T1.403, T1.404, GR 499, G.747, and G.775.

### E13 Features (3)

- Configurable multiplexer/demultiplexer for up to 16 E1 signals, or 4 E2 signals to/from an E3 signal.
- Independently configurable 4 E12 multiplexer/demultiplexers for up to 16 E1 signals to/from 4 E2 signals.
- Provisionable time-slot selection for E1, E2 insertion, or drop via the cross connect macro.
- E12 multiplexers capable of generating alarm indication signal (AIS) and remote alarm indicator (RAI) signals.
- E23 multiplexer capable of generating AIS and RAI signals.
- Configurable HDB3 encoder/decoder for E3 output/input.
- E1 and E2 transmit path monitors that detect loss of clock (LOC) and AIS.
- E2 receive path monitor that detects LOC, AIS, and RAI.
- E3 receive monitor that detects loss of signal (LOS), LOC, bipolar violation (BPV), AIS, and RAI.
- E3 and E2 loopback modes.
- Complies with ITU's G.703, G.742, G.751, and G.775.

### DS3/DS2/DS1/E1 Cross Connect Features

- Configurable crosspoint interconnect for up to 28 x 3 DS1 signals or 21 x 3 E1 signals to/from the framer, 30 external pins, and 28 x 3 signal channels to/from the M13 and VT mapper. Also supports up to 7 x 3 DS2 signals to/from the external pins or M12 MUXes, connecting to the M13 MUX M23 block.
- Connects six clear channel DS3, E3, and STS-1 signals from the external pins to the M13, E13, SPE\_mapper, and STS1-LT.
- Also connects three unchannelized DS3 and E3 signal to/from the external NSMI interface to the SPE, M13, E13, framer, or TPG blocks.
- The three NSMI pins can also be shared for STS-1 LT.
- Any mix of 168 DS1, E1 signals may be interconnected. Any of the available DS1/E1 signal sources may be connected to any of 168 signal destinations in the DS1/E1 cross connect. Multicast or broadcast operation (one port to many) is supported for up to 168 channels. Also, any channel n at the source can be connected to its corresponding destination channel n, where n ranges from 1 to 84 for most sources and destinations.

## Features (continued)

- Any mix of DS2, DS3, or E3 signals may be interconnected.
- Cross connect allows 16 x 3 E1 signals to/from E13 modules to framer, M13, VT mapper, and external pins.
- There are 4 x 3 E2 signals to/from E13 to external pins, TPG generator/monitor.
- There are 3 E3 signals to/from the E13 block to external pins, TPG generator/monitor, and SPE mapper.
- Jitter attenuation may also be inserted in-line on any DS1/E1 channel. (Note that cascading of jitter attenuators is not allowed.)
- Standard network loopback or straightaway facility testing is supported for DS1/E1 and DS3/E3. Any source or transmitter may be replaced by a test-pattern generator capable of injecting idle standards-based pseudorandom bit sequence test patterns, or AIS (blue) alarm. Any sink or receiver may be replaced by a test-pattern monitor, which can detect/count bit errors in a pseudorandom test sequence, or loss of frame or loss of synchronization.
- One to any loopback is supported for up to 168 channels in DS1/E1 channels in blocks VT mapper, M13, E13, and framer. One-to-one loopback is supported in all DS1/E1 channels. One-to-one loopback for DS3/E3/STS-1 channels in blocks M13, E13, and SPE mapper.
- Loopbacks may be configured to sectionalize a circuit for identifying faults or misconfiguration during out of service maintenance.
- Fast alarm channels are supported for VT mapper, E13, or M13 to framer interconnects for alarm indication signal (AIS or blue alarm), and VT mapper only for remote alarm indicator (RAI or yellow alarm). This feature reduces the propagation delay of the alarms by eliminating multiple integration of alarm conditions.
- Supports framer-only, transport (framer LIU, M13, E13, and VT mapper), and switching (CHI and PSB) modes of operation.
- TOAC outputs are available in DS1/E1 framed format at any destination. Any DS1/E1 channel can be used as TOAC inputs.

## DS1/E1 Digital Jitter Attenuation Features

- PLL-free receive operation using built-in digital jitter attenuator (in VT/VC mode or M13 mode).
- Configurable to meet jitter and MTIE requirements.

## DS3/E3 Digital Jitter Attenuation Features

- The PLL bandwidth, damping factor, and sampling rates are programmable.
- The DJA macro accepts/delivers DS3/E3 clock and data from/to the cross connect macrocell.

## T1/E1/J1 Framing Features 84/63 (3x28/21)

- 28/21 T1/E1/J1 channels.
- Line coding: B8ZS, HDB3, ZCS, AMI, and CMI (JJ20-11).
- T1 framing modes: ESF, D4, *SLC*<sup>®</sup>-96, T1 DM DDS, and SF (Ft only).
- E1 framing: G.704 basic and CRC-4 multiframe consistent with G.706.
- J1 framing modes: JESF (Japan).
- Supports T1 and E1 unframed and transparent transmission format.
- T1 signaling modes: transparent; register and system access for ESF 2-state, 4-state, and 16-state; D4 2-state, 4-state, and 16-state; *SLC*-96 2-state, 4-state, and 16-state; J-ESF handling groups maintenance and signaling; VT 1.5 SPE 2-, 4-, 16-state.
- E1 signaling modes: transparent; register and system access for entire TS16 multiframe structure as per ITU G.732.
- Signaling debounce and change of state interrupt.
- V5.2 Sa7 processing.
- Alarm reporting and performance monitoring per AT&T, *ANSI*, ITU-T, and ETSI standards.
- Facility data link features:
  - HDLC or transparent access for either ESF or DDS+ FDL frame formats.
  - Register/stack access for *SLC*-96 transmit and receive data.
  - Extended superframe (ESF): automatic transmission of the ESF performance report messages (PRM). Automatic transmission of the *ANSI* T1.403 ESF performance report messages. Automatic detection and transmission of the *ANSI* T1.403 ESF FDL bit-oriented codes.
  - Register/stack access for all CEPT Sa-bits transmit and receive data.
- HDLC features:
  - HDLC or transparent mode.
  - Programmable logical channel assignment: any time slot, any bit for ISDN D-channel, also inserts/extracts C-channels for V5.1, V5.2 interfaces.
  - 64 logical channels in both transmit and receive direction (any framing format).

## Features (continued)

- Maximum channel data rate: 64 kbits/s.
- Minimum channel data rate: 4 kbits/s (DS1-FDL or E1 Sa-bit).
- 128-byte FIFO per channel in both transmit and receive direction.
- Tx to Rx loopback supported.
- System interfaces:
  - Concentration highway interface.
  - Single clock and frame synchronizing signals; programmable clock rates at 2.048 MHz, 4.096 MHz, 8.192 MHz, and 16.384 MHz; programmable data rates at 2.048 Mbits/s, 4.096 Mbits/s, and 8.192 Mbits/s; programmable clock edges and bit/byte offsets.
  - Parallel system bus interface at 19.44 MHz for data and signaling: single clock and frame synchronizing signals.
  - Time-division multiplex data rate serial interface at 1.544 MHz or 2.048 MHz. Twenty-eight receive data, clock, and frame synchronizing signals. Twenty-eight transmit data signals with a global clock and frame synchronization.
  - Network serial multiplexed interface (NSMI) minimal pin count serial interface at 51.84 MHz optimized for data and IMA applications.

## MPU Features

- 21-bit address/16-bit data bus microprocessor interface.
- Synchronous (16 MHz to 66 MHz)/asynchronous microprocessor interface modes.
- Microprocessor data bus parity monitoring.
- Summary of 2 level priority interrupts from major functional blocks/maskable.
- Separate device interrupt outputs for automatic protection switch and the Ultramapper global interrupt.
- Global configuration of network performance monitoring counters operation.
- Global software resets.
- Global enabling and powering down of major functional blocks.
- Miscellaneous global configuration and control.

## SPEMPR Features

- The SPE mapper accepts/delivers TUG-2 data from/to the VT mapper. The TUG-2 data is mapped/demapped either to/from an AU-3/STS-1 signal for the North American digital systems or to/from a TUG-3 signal for the ITU-based systems.
- The SPE mapper accepts/delivers DS3 data from/to the M13 MUX/deMUX. The DS3 data is mapped/demapped either to/from an AU-3/STS-1 signal for the North American digital systems or to/from a TUG-3 signal for the ITU-based systems.
- The SPE mapper accepts/delivers a clear DS3 signal at 44.736 Mbits/s rate. The clear DS3 signal is mapped/demapped essentially the same way as M13 signal described above.
- The SPE mapper accepts/delivers E3 data from/to the E13 MUX/deMUX. The E3 data is mapped/demapped either to/from an AU-3/STS-1 signal for the North American digital systems or to/from a TUG-3 signal for the ITU-based systems.
- The SPE mapper accepts/delivers a clear E3 signal at 34.368 Mbits/s rate. The clear E3 signal is mapped/demapped essentially the same way as E13 signal described above.
- The SPE mapper has a DS3/E3 loopback circuit placed for the functions of demapping and remapping a DS3/E3 signal. It is particularly useful in cases where a DS3/E3 signal mapped as an AU-3/STS-1 signal has to be remapped as a TUG-3 signal or vice versa.
- The SPE mapper supports a path overhead access channel more commonly known as the POAC channel. Seven path overhead bytes namely J1, C2, F2, H4, F3, K3, and N1 may be inserted/dropped through this channel. This channel works as the master, which means that this channel provides a clock in both transmit and receive directions and POH data may be inserted by the user on the transmit side or dropped by the block in the receive side.
- Path overhead byte B3 (BIP error) generation/detection and programmable BIP-8 bit error rate insertion.
- Programmable clear on read/clear on write registers.
- Signal fail and signal degrade indicators available to report bit error rates above a certain programmable threshold.

## Features (continued)

- Capable of detecting/inserting alarm indication signals (AIS), remote defect indication signals (RDI), and remote error indication signals (REI).
- Numerous monitoring functions provided on all the TUG-3 path overhead bytes.
- Supports unidirectional path switch ring (UPSR) applications.
- N1 tandem connection support is provided.
- The TUG3 pointer processor can be used for an add/drop multiplexer.
- Complies with GR-253-CORE, T1.105, ITU-T G.707, ITU-T G.831, G.783, ETS 300 417-1-1.

## STS12 Pointer Processor Features

- SONET and SDH compliant.
- Configurable STS-3/STM-1 or STS-12/STM-4 mode.
- Supporting an arbitrary mix of STS-1 and STS3c tributaries, and SDH equivalents.
- Complies with GR-253-CORE, T1.105, G.707, G.783, G.806, G.821, and ETSI 417-1-1.

## STS1LT Features

- Supports standard SPE mappings for sub-STIS-1 payloads (VT mapped: 28 DS1, 28 J1, or 21 E1 signals).
- Supports standard SPE mappings for STS-1 payloads ( DS3).
- Detects STS-1 loss-of-signal (LOS) conditions.
- Detects STS-1 out-of-frame and loss-of-frame (OOF/LOF) conditions.
- Provides an 8-bit parallel bus interface for an STS-1 signal.
- Provides STS-1 selectable scrambler/descrambler functions and B1/B2/B3 generation/detection.
- Provides STS-1 pointer interpretation. Detects AIS-P and LOP.
- Provides STS-1 pointer processing.
- Complies with GR-253-CORE, T1.105, G.707, G.783, G.826, G.821, and ETSI 417-1-1.

## STS1 XC Features

- Configurable connection for up to 6 STS1 signals from 6 SPE mapper transmit blocks to any 1 up to

3 STS1 slots of any 1 of 4 TMUX transmit interfaces. Clock and control signals are provided by the TMUX transmit interfaces and data is supplied by the SPE mapper transmit blocks.

- Configurable connection for up to 3 STS1 signals from 3 STS1LT PP blocks to any 1 up to 3 STS1 slots of any 1 of 4 TMUX transmit interfaces. Clock and control signals are provided by the TMUX transmit interfaces and data is supplied by the STS1LT receive blocks.
- Configurable connection for up to 12 STS1 signals from the STS12PP transmit block to any 1 up to 3 STS1 slots of any 1 of 4 TMUX transmit interfaces. Clock and control signals are provided by the TMUX transmit interfaces and data is supplied by the STS12PP transmit blocks.
- Configurable connection for up to 9 STS1 signals from 3 CDR receive blocks to any 1 up to 3 STS1 slots of any 1 of 4 TMUX transmit interfaces. Clock and control signals are provided by the TMUX transmit interfaces and data is supplied by the CDR receive blocks.
- Configurable connection for up to 3 STS1 signals from 6 SPE mapper transmit blocks to any 1 of 3 STS1LT transmit blocks. Clock and control signals are provided by the STS1LT transmit block and data is supplied by the SPE mapper transmit block.
- Configurable connection for up to 3 STS1 signals from any 1 up to 3 STS1 slots of any 1 of 4 TMUX receive interfaces to any 1 of 3 STS1LT transmit blocks. Data is provided by the TMUX receive interfaces for this transfer.
- Configurable connection for up to 9 STS1 signals from any 1 up to 3 STS1 slots of any 1 of 4 TMUX receive interfaces to any 1 of 3 CDR transmit blocks. Clock, control signals, and data are provided by the TMUX receive interfaces for this transfer.
- Configurable connection for up to 3 STS1 signals from 3 STS1LT receive blocks to any 1 of 6 SPE mapper receive blocks. Clock, control signals, and data are provided by the STS1LT receive block for this transfer.
- Configurable connection for up to 6 STS1 signals from any 1 up to 3 STS1 slots of any 1 of 4 TMUX receive interfaces to any 1 of 6 SPE mapper receive blocks. Clock, control signals, and data are provided by the TMUX receive interfaces for this transfer.
- Loss of clock detectors on three serial 155 MHz clock inputs from three CRD RX blocks and one serial 155 MHz clock input from CDR TX block.

## Features (continued)

- LOF detection, OOF detection, REI monitoring, RDI monitoring, and B2 error detection is performed on the three serial 155 Mbits/s data inputs from the CDR receive blocks.
- REI and RDI are generated from the received data and sent to the transmit side for insertion in the transmitted serial 155 Mbits/s data.
- B2 is calculated and inserted in the transmitted serial data. B2 error insertion is allowed.

## TMUX Features

- Multiplexes twelve STS-1 signals or four STS-3c signals into a SONET STS-12 signal.
- Multiplexes three STS-1 signals into a SONET STS-3 signal.
- Multiplexes four STM-1 (AU-4 or 3xAU-3) signals into an SDH STM-4 signal.
- Multiplexes three VC-3 signals into an SDH STM-1 (3xAU-3) signal.
- Multiplexes three VC-3 signals into an SDH STM-1 (AU-4) signal via a TUG-3 construction.
- Demultiplexes twelve STS-1 signals or four STS-3c signals from a SONET STS-12 signal.
- Demultiplexes three STS-1 signals from a SONET STS-3 signal.
- Demultiplexes four STM-1 (AU-4 or 3xAU-3) signals from an SDH STM-4.
- Demultiplexes three VC-3 signals from an SDH STM-1 (3xAU-3) signal.
- Demultiplexes three VC-3 signals from an SDH STM-1 (AU-4) signal via a TUG-3 deconstruction.
- Provides STS1-only mode for receive and transmit directions.
- Provides complete functionality for SDH MSP 1 + 1 protection switching.
- Provides SONET/SDH loss-of-signal (LOS), out-of-frame (OOF) and loss-of-frame (LOF) detection.
- Provides STS-12/STM-4/STS-3/STM-1/STS1 selectable scrambler/descrambler functions.
- Provides STS-12/STM-4/STS-3/STM-1/STS1 B1/B2/B3 generation/detection.
- Provides STS-12/STM-1/STS-3/STM-1/STS1/pointer interpretation.
- Complies with GR-253-CORE, T1.105, G.707, G.783, G.806, G.821, and ETSI 417-1-1.

## VT/TU Features

- Maps T1/E1/J1 into VT/TU structures:
  - T1 into VT1.5/TU-11/TU-12.
  - J1 into VT1.5/TU-11/TU-12.
  - E1 into VT2/TU-12.
- Maps VC-11/VC-12 into VTG/TUG-2 structures:
  - VC-11 into VT1.5/TU-11/TU-12/VTG/TUG-2.
  - VC-12 into VT2/TU-12/VTG/TUG-2.
- Supports asynchronous, byte synchronous, and bit synchronous mappings.
- Supports automatic generation or microprocessor overwrite of one bit RDI-V and one bit RFI-V.
- Supports automatic generation or microprocessor overwrite of enhanced RDI-V.
- Supports ADM applications with tributary loopback and tributary pointer processing.
- Supports unidirectional path switch ring (UPSR) applications with a low-order path overhead access channel.
- Supports TIM-V generation and termination for all 28/21 VT/TU signals.
- Supports BIP-V BER insertion and detection.
- Supports fast AIS generation for downstream devices.
- Supports one second error counters for BIP-V and REI-V.
- Complies with GR-253-CORE, G.707, T1.105, G.704, G.783, JT-G707, GR-499, ETS 300 417-1-1.

## Test Pattern Generator Features

- Configurable test pattern generator: DS1, E1, DS2, E3, DS3, and STS1 formats.
- Pseudorandom bit sequence (PRBS, also known as pseudonoise or PN sequences) based on maximal-length feedback shift register sequences; PN codes selectable from the following options: QRSS, PRBS15, PRBS20, PRBS23, ALT\_01, ALL\_ONES, USER pattern (16 bits, repeating).
- The test pattern can be transmitted either unframed or as the payload of a framed signal as defined in ITU-T.
- Single bit errors or framing errors may be injected into any test pattern, under register control.
- Any sink or receiving channel may be replaced by a test pattern monitor, which can detect and count bit errors or misconfigurations, and/or detect idle conditions or AIS.

## Features (continued)

- DataLink (DS1-ESF DL) and SSM (E1 multiframe Sa) fields read/writable.
- Supports all Ultramapper modes of operation.
- Complies with T1.107, T1.231, T1.403, G.703, G.704, O.150.

## CDR Features

- Receives data at OC-12/STS-12 (622.08 Mbits/s) data rate.
- Single low-voltage power supply.
- 155.52 MHz or 77.76 MHz input reference clock for on-chip PLL.
- On-chip PLL for clock synthesis, requiring only one external resistor, generating 16 phases, providing resolution of ~100 ps.
- PLL bypass mode for functional test.
- Modular design to incorporate  $n = 2$  to 16 channels.
- Meets type B jitter tolerance specification of ITU-T Recommendation G.958.
- No output clock drift in absence of data transitions once lock is acquired.
- Built-in test features.

## System Test and Maintenance

- A variety of loopback modes implemented on SONET/SDH side as well as on framer level.
- Built-in test pattern generator and monitor configurable for simultaneously testing E1, DS1, DS2, E3, DS3, and STS1 (one channel each).

## Microprocessor Interface

- 21-bit address and 16-bit data interface with 16 MHz to 66 MHz read and write access.
- Compatible with most industry-standard processors.

## Chip Testing and Maintenance

- *IEEE* \* 1149.1 JTAG boundary scan.

## Interface to Other Agere Devices

Seamless interface to the following Agere Systems devices:

- TADM042G5
- Super Mapper

\* *IEEE* is a registered trademark of the Institute of Electrical and Electronics Engineers, Inc

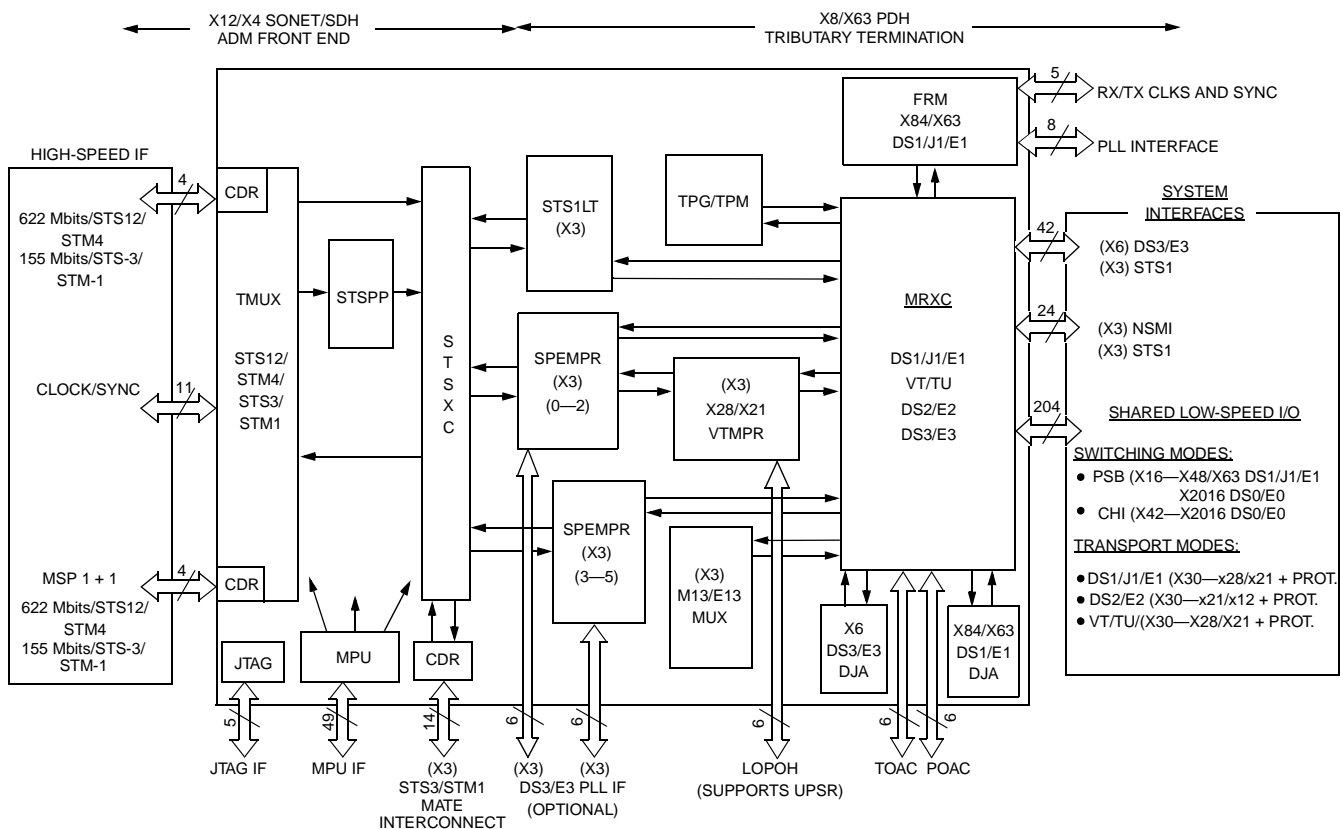

## 2 The SONET/SDH Ultramapper

### 2.1 Overview

The SONET/SDH Ultramapper device integrates the SONET/SDH line, path, and tributary termination functions with M13/E13 multiplex functions and the primary rate framing function. It is designed to drive either an OC-12/STM-4 or OC-3/STM-1 optical signal directly or to allow for modular growth in terminal or add/drop applications.

The Ultramapper provides a versatile interface for all STS-12/STM-4, STS-3/STM-1, and STS-1 termination applications in point-to-point scenarios and for ring applications. This chip can be used in tributary shelf applications for up to 84 T1 or J1 or 63 E1 line cards, providing all possible mappings into SONET/SDH, because of the flexibility of the mappings, software upgrades from M13/E13 mapped connections to VT/TU mapped connections are possible. This device can also be used for DS3/E3/DS2 applications.

A single Ultramapper is capable of processing the aggregate bandwidth of one STS-3/STM-1 to 84/63 DS1/E1s. Further, a single Ultramapper can process the aggregate bandwidth of two STS-3/STM-1s, terminated as an STS-12/STM-4, to six DS3/E3s. Additionally, a single Ultramapper can function as an STS-12/STS-3/STM-4/STM-1 add-drop MUX by terminating up to three STS-1/STM-0 channels or one AU-4 channel and using the internal pointer processors to forward any nonterminated channels. By communicating to three other mate devices via the serial STS-3/STM-1 link interface, it is capable of terminating a full STS-12/STM-4 signal.

Figure 2. Switching Application of the Ultramapper

1939 (F)

Figure 3. Transport Application of the Ultramapper

2 The SONET/SDH Ultramapper (continued)

1084 (F)

Note: In this application, 84/63 DS1/E1s per Ultramapper can be MUXed to a total of three DS3/E3 and then mapped to STS-1/AU-3, STS-3/STM-1, or STS-12/STM-4 as desired. Alternatively, 84/63 DS1/E1s per Ultramapper can be mapped to 84.63 VT/TU and then mapped to STS-1/AU-3, STS-3/STM-1, or STS-12/STM-4 as desired.

Figure 4. Switching Application: Four Ultramappers Terminating STS-12/STM-4; One Ultramapper Terminating STS-3/STM-1

1081 (F)

Note: Possible application would be add-drop of 28/21 T1/E1s to/from STS-12/STM-4/STS-3/STM-1.

Note: In this application, up to three DS3, E3, or EC1 per Ultramapper can be deMUXed to 84/63 DS1/E1, mapped to 84/63 VT/TU, and then mapped to STS-1/AU-3, STS-3/STM-1, or STS-12/STM-4 as desired.

**Figure 6. TransMUX Application: Four Ultramappers Mapping Clear Channel DS3/E3/EC-1 to VT/TU and Terminating as STS-12/STM-4**

1083 (F)

Note: In this application, up to three DS3 or E3 embedded in STS-1/AU-3 per Ultramapper can be deMUXed to 84/63 DS1/E1, mapped to 84/63 VT/TU, and then mapped to STS-1/AU-3. Simultaneously, up to 84/63 VT/TU embedded in STS-1/AU-3 per Ultramapper can be demapped to 84/63 DS1/E1, then multiplexed to 3 DS3 or E3 embedded in STS-1/AU-3.

**Figure 7. Portless TransMUX Application: Two Ultramappers Required for STS-12/STM-4 to Map 6 x STS-1 (DS3 Mapped) to/from 6 x STS-1 (VT Mapped)**

2 The SONET/SDH Ultramapper (continued)

1086 (F)

Note: In this application, each Ultramapper maps six clear channels DS3s or E3s (any combination) through the SPE/AU-3 mapper to STS-1s or TUG-3s. Utilizing the mate interface, one Ultramapper provides an STS-12/STM-4 termination.

**Figure 8. DS3/E3 Mapped to SONET/SDH-2 Ultramappers Mapping 12 DS3/E3 into STS-1s or TUGs and Ultimately to STS-12/STM-4**

1082 (F)

Note: Using the DS1/E1 framers, DS3/E3 framers, and the M13 MUX, the Ultramapper can be used to MUX up to 84/63 T1/E1s to three DS3/E3s.

**Figure 9. M13 MUX and Framing Application: 84/63 DS1/E1 (NSMI System Bus) MUXed to Three DS3/E3**

## 2 The SONET/SDH Ultramapper (continued)

### 2.3 High-Speed Line Interfaces and Clock and Data Recovery

In the receive direction, the Ultramapper accepts either a differential serial data signal at 155.52 Mb/s (STS-3/STM-1 mode) or a serial STS-1 clock and data at 51.84 MHz (STS-1 mode). For the STS-1 case, the input is retimed with the input clock. A clock and data recovery circuit is used for the 155 Mb/s case with the high-speed transmit input clock as the clock reference. In the event that external clock and data recovery is provided, this feature can be bypassed. The clock and data circuit can be used for recovering clock at 51 MHz, but a 155 MHz clock reference must still be supplied.

On the transmit side, in STS-3/STM-1 mode, the Ultramapper receives a differential 155.52 MHz transmit clock and transmit frame synchronizing signal and outputs a differential serial data signal. In STS-1 mode, it receives a 51.84 MHz transmit clock and frame synchronizing signal and outputs serial data.

Loss of input clock or recovered clock is detected, as well as a loss-of-signal condition, by monitoring an external signal pin or an internal all-zeros/ones pattern.

Built-in loopbacks at both high-speed interfaces provide maximum flexibility for maintenance testing.

#### 2.3.1 Receive Direction

Terminating the transport overhead (TOH), the Ultramapper performs frame alignment (STS-3/STM-1 or STS-1), B1 BIP-8 check, J0 monitoring, descrambling, F1 monitoring, B2 BIP-8 check, APS and K2 monitoring, AIS-L and RDI-L detection, M1 REI-L detection, S1 synchronization status monitoring, and transport overhead access channel (RTOAC) drop.

The states of the framer as well as all state changes are reported, and, if not masked, cause an interrupt.

The B1 and B2 parity check supports bit and block mode. The counters count up to one second worth of BIP errors. They stay at their maximum value in case of overflow or rollover and should be read (and cleared) at least once per second.

The J0 monitor supports nonframed, SONET-framed, and SDH-framed 16-byte sequences, as well as single J0 byte monitoring modes.

APS monitoring is performed on K1[7:0] and K2[7:3]. The value is stored and changes are reported. Bits [2:0] of the K2 byte are monitored independently.

Line AIS (AIS-L/MS-AIS) and remote defect indication (RDI-L/MS-RDI) are monitored separately and changes are reported. This information is also sent to the protection device for ADM applications.

The M1 monitor operates either in bit or block mode and allows accessing of the remote error indication (REI-L/MS-REI) errored bit count.

The S1 byte can be monitored in two modes: as an entire 8-bit word or as one 4-bit nibble (bits 7:4).

Continuous N times detection counters are implemented for these monitoring functions. All automatic receive monitoring functions can be configured to provide an interrupt to the control system, or the device can be operated in a polled mode.

The receive transport overhead access channel (RTOAC) provides access to all of the line section overhead bytes. Even or odd parity is calculated over all bytes. It has a data rate of 5.184 Mb/s and consists of a clock, data, and an 8 kHz synchronizing pulse. Alternatively, only the data communication channels D1:D3 or D4:D12 may transmit a serial 192 kb/s or a 576 kb/s data stream.

## 2 The SONET/SDH Ultramapper (continued)

### 2.3.2 Transmit Direction

In the transmit direction, the Ultramapper performs transmit transport overhead access channel (TTOAC) insertion, synchronizing status byte (S1) insertion, M0/M1—REI-L insertion, K1 and K2 insertion, AIS-L insertion, B2 calculation and insertion, F1 byte insertion, B1 generation and error insertion, scrambler, J0 insert control, and A2 error insertion. All insert control functions that are inhibited will optionally insert either all zeros or all ones. The TTOAC allows the users to insert the following overhead bytes: E1, F1, D1:D3, D4:D12, S1, and E2. Even or odd parity is checked over all bytes. Bytes which are not enabled for insertion are set to an all-ones or all-zeros stuff value. The Ultramapper sources a clock and an 8 kHz synchronizing pulse and receives the data at a data rate of 5.184 Mb/s. Alternatively, only the data communication channels D1—D3 or D4—D12 may receive a serial 192 kb/s or a 576 kb/s data stream.

The insertion (overwrite of TTOAC) of programmed S1, F1, J0, Z0-2, and Z0-3 bytes can be enabled.

Automatic insertion of M0/M1 may be inhibited. A protection switch selects the REI-L value for insertion to be taken from the protection board rather than from the receive side.

The entire APS value or K2[2:0] can be inserted via microprocessor control. Automatic RDI insertion is supported with individual inhibit for each contributor. A protection switch selects the RDI-L value for insertion to be taken from the protection board rather than from the receive side.

B1 and B2 BIP-8 values are calculated and inserted. Both values can be inverted.

### 2.4 Multiplex Section Protection (MSP 1 + 1)

The TMUX block supports a payload 1 + 1 protection switch. In the receive direction, this occurs prior to pointer interpretation. If the protection switch is activated, then the data is selected from the receive protection interface rather than from the high-speed input path.

In the transmit direction, the signal is broadcast to the high-speed output path and the protection interface.

The interface consists of a 155.52 MHz or 51.84 MHz clock, data, and synchronizing pulse in each direction.

#### 2.4.1 Pointer Interpreter

This state machine implements the pointer interpretation algorithm described in ETS 300 417-1-1: January 1996—Annex B.

The pointer interpreter evaluates the current pointer state for the normal state, path AIS state, or LOP (loss of pointer) conditions, as well as pointer increments and decrements. The current pointer state and any changes in pointer condition are reported to the control system. The number of consecutive frames for invalid pointer and invalid concatenation indication is fixed at nine.

#### 2.4.2 Path Termination Function

The path termination function is performed on either all three STS-1s or on the VC-4 POH only.

It includes on the receive side: J1 monitoring, B3 BIP-8 checking, C2 signal label monitoring, REI-P and RDI-P detection, H4 multiframe monitoring; F2, F3, and K3 automatic protection switch monitoring, N1 tandem connection monitoring, signal degrade BER and signal fail BER detection; path overhead access channel (RPOAC) drop, AIS-P/HO-AIS insertion, and automatic AIS generation (with individual inhibit).

The J1 monitor provides five modes of operation on a programmable length (1 byte—64 bytes) of the trace identifier: cyclic checking against the last received sequence, comparing against a programmed sequence, SONET framing mode, SDH framing mode, and consecutive consistent occurrences of a new pattern.

## 2 The SONET/SDH Ultramapper (continued)

B3 is monitored either in bit or block mode. Provisionable N-times detection counters are implemented for C2, F2, F3, N1, and K3 bytes. The K3 APS byte and N1 TCM byte can be monitored as an entire 8-bit word or two 4-bit nibbles.

The receive path overhead access channel (RPOAC) provides access to all the path overhead bytes. Even or odd parity is calculated over all bytes. It has a data rate of 8 bytes per 8 kHz frame and consists of clock, data, and an 8 kHz synchronizing pulse.

In the transmit direction, J1 path trace insertion, B3 calculation and insertion, C2 signal label insertion, REI-P and RDI-P insertion; F2 insertion, H4 multiframe insertion, F3 path user byte insertion, K3 insertion, N1 byte insertion, and AIS-P insertion via POAC or software control is supported.

The transmit path overhead access channel (TPOAC) allows the insertion of all overhead bytes besides B3 which is automatically calculated. Even or odd parity is checked over all bytes. Bytes which are not enabled for insertion are set to an all-ones or all-zeros stuff value. The Ultramapper sources a clock and an 8 kHz synchronizing pulse and receives the data at a rate of 8 bytes per 8 kHz frame.

### 2.5 STS-3/STM-1 Overhead Termination and Pointer Processing

The information on overhead termination and pointer processing is not available at this time.

### 2.6 STS-3/STM-1 MUX-DeMUX

The STS-3/STM-1 (AU-4) multiplexer provides three modes of operation: STS-3, AU-4, and STS-1.

In STS-3 mode, the block multiplexes and demultiplexes up to three STS-1 signals to/from a SONET STS-3 signal. In AU-4 mode, it provides the functionality to MUX/deMUX up to three AU-3 signals to/from a STM-1 (AU-4) signal. In STS-1 mode, it provides the functions to generate and terminate a single STS-1 signal.

The STS-3/STM-1 MUX function takes the bytes in the order they are present on the telecom bus and multiplexes them into the high-speed signal. Grooming of the VTs/VCs is performed in the SPE mapper of each of the three devices.

### 2.7 STS-3 Serial Interconnect

The information on the STS-3 serial interconnect is not available at this time.

### 2.8 STS-12/STM-4 Pointer Processor

The information on the STS-12/STM-4 pointer processor is not available at this time.

### 2.9 STS-3/STM-1 Interface to Mate Devices

The Ultramapper can communicate with up to three mate devices via STS-3/STM-1 interfaces. One Ultramapper is provisioned as a master and the other three are provisioned as slaves. This provides for full external termination of the STS-12/STM-4 payload.

## 2 The SONET/SDH Ultramapper (continued)

### 2.10 SPE/AU-3 Mapper (DS3 Mapper)

The SPE mapper block is a highly configurable mapper. It operates either as an AU-3/STS-1 mapper or as a TUG-3 mapper. In both modes, it maps/demaps data from/to either the VT mapper, the M13 MUX/deMUX, the DS3 clear channel, or the DS3 loopback channel. The SPE mapper supports numerous automatic monitoring functions and provides interrupts to the control system, or it can be operated in a polled mode. In TU mapping mode, the SPE mapper provides flexibility down to TUG-2 level for choosing which TUG-2s (out of 7) are mapped/dropped into/from which TUG-3s (between 1 and 3) for generating STM-1 signals. This allows grooming of the VTs/TUs on the STM-1 level (over all three devices). In a full STM-1 application, with two other devices sitting on the telecom bus, care has to be taken for the provisioning of the time slots when each block drives the telecom bus.

In DS3 mapping mode, the SPE mapper block accepts/delivers structured DS3 data from/to the M13 block or a clear DS3 signal at 44.736 Mb/s rate and maps/demaps it asynchronously into/from the STS-1 SPE or a TU-3. The DS3 mapper generates a fixed pointer value of 522. On the receive side, pointer interpretation is performed detecting LOP, AIS, NDF, NORM, INC, and DEC. A DS3 loopback mode allows demapping and remapping of a DS3 signal. It is particularly useful in cases where a DS3 signal mapped as an AU-3/STS-1 signal is needed to be remapped as a TU-3 signal or vice versa. B3ZS encoding/decoding is included.

The same path overhead monitoring functions (as described above) are implemented in this block.

This block also connects to the path overhead access channel (POAC) to insert/drop the path overhead bytes J1, C2, F2, H4, F3, K3, and N1 into the STS-1 SPE or VC-3.

Supports unidirectional path switch ring (UPSR) applications as well as N1 tandem connection function.

Complies with GR-253-CORE, T1.105, ITU-T G.707, ITU-T G.831, G.783, and ETS 300 417-1-1.

### 2.11 VT/TU Mapper

The VT/TU mapper maps any valid combination of DS1 and E1 signals into a stream at a rate of 51.84 Mb/s (STS-1 or AU-3). The mapping methods (VT1.5, VT2, and VT group in *ANSI* nomenclature; TU-11, TU-12, and TUG-2 in ITU nomenclature) are analogous. The VT/VC mapper supports the following mappings:

- 84 asynchronous, byte-, or bit-synchronous DS1 signals are mapped into seven VT groups or TUG-2s.
- 84 asynchronous, byte-, or bit-synchronous J1 signals are mapped into seven VT groups or TUG-2s.
- 63 asynchronous, byte-, or bit-synchronous E1 signals are mapped into seven VT groups or TUG-2s.
- Maps T1 into VT1.5/TU-11/TU-12, J1 into VT1.5/TU-11/TU-12, and E1 into VT2/TU-12.

ADM and unidirectional path switch ring (UPSR) applications are supported via tributary loopback, tributary pointer processing, and low-order path overhead access channel.

Supports automatic generation or microprocessor overwrite 1-bit RDI, enhanced RDI, 1-bit RFI, automatic downstream AIS generation, and five J2 trace identifier modes.

Complies with GR-253-CORE, G.707, T1.105, G.704, G.783, JT-G707, GR-499, and ETS 300 417-1-1.

#### 2.11.1 Receive Direction

In the receive direction, the VT mapper terminates the data stream it receives from the SPE mapper. It demultiplexes the AU-3/TUG-3 into the VTs/TUs and checks the H4 multiframe alignment. Pointer interpreters for up to 84 VTs/TUs detect LOP, AIS, NDF, NORM, INC, and DEC on each channel.

## 2 The SONET/SDH Ultramapper (continued)

The low-order path termination includes V5 byte termination, J2 path trace, Z6/N2 tandem connection, Z7/K4 enhanced RDI and low-order APS monitor, and the payload termination for asynchronous, byte- or bit-synchronous signals. The V5 byte termination performs BIP-2 check (bit- or block-mode), REI count, RFI and RDI detection, signal label monitor, and automatic AIS insertion (which can be inhibited). The J2 monitor supports four different modes as follows:

- Cyclic check
- SONET framing mode
- SDH framing mode
- Single byte check

In byte-synchronous modes, the receive demapper generates a frame synchronization signal to indicate the DS1 frame bit or the MSB of the E1 time-slot 0. Additionally, it provides the framer access to the received signaling bits. Output of the VT mapper is a DS1/J1/E1 signal with a gapped clock. It can be overwritten with AIS automatically or upon microprocessor request.

### 2.11.2 Transmit Direction

In the transmit direction, the VT mapper gets a clock, data, and frame synchronization signal from the cross connect. The input is retimed and checked for a digital loss of clock (LOC), an AIS condition, and low zeros density. In byte-synchronous mode, the input signal is additionally checked for loss of frame synchronization (LOFS).

A transmit elastic store synchronizes the incoming DS1/J1/E1 signals to the local STS-1 clock. In asynchronous and bit-synchronous mode, it works as a bit-oriented (64-bit) FIFO, and in byte-synchronous mode as a byte-wide (8-byte) buffer using a V5 byte marker bit (8-bit). Overflow or underflow conditions are monitored and reported.

In asynchronous and bit-synchronous mode, a fixed VT pointer of 78 (VT1.5/TU-11) and 105 (VT2/TU-12) is generated and the payload is mapped into the container using positive/null/negative bit stuffing mechanism (C- and S-bits). In bit-synchronous mode, the bit stuffing mechanism is disabled. In byte-synchronous mode, a dynamic VT pointer value is generated using the V5 marker implementing NORM, NDF, INC, and DEC pointers.

The VT POH generation comprises V5 byte with BIP2-generation, AIS-, signal label-, UNEQ-insertion, automatic REI-, RFI-, RDI-, and enhanced RDI-generation (*Bellcore*\*, ITU-T), J2 path trace insertion via microprocessor, Z6/N2 byte insertion, and Z7/K4 byte insertion via microprocessor or low-order path overhead (LOPOH) access channel.

The data stream is synchronized to the received 2 kHz synchronization pulse and multiplexed to form the STS-1/AU-3 signal, which is then output to the SPE mapper.

When operating in byte-synchronous mode, the phase and signaling bits from the framer are stored and inserted into the mapped frame.

### 2.12 M13/M23 Multiplexer

The M13 is a highly-configurable multiplexer/demultiplexer. It can operate as an M13 in either the C-bit parity or M23 mode, a mixed M13/M23, or an M23. In the C-bit parity mode, the M13 provides a far-end alarm and control (FEAC) code generator and receiver, an HDLC transmitter and receiver, and automatic far-end block error (FEBE) generation.

\* *Bellcore* is now Telecordia TEchnologies, Inc.

## 2 The SONET/SDH Ultramapper (continued)

Each internal M12 MUX/deMUX and the M23 MUX/deMUX may be configured to operate as independent MUXs/deMUXs. 84 DS1 inputs in groups of four or 63 E1 input signals in groups of three can feed into individual M12 MUXs, while the M23 MUX can take DS2 signals from outputs of M12 MUXs, or direct DS2 inputs, or loopback deMUXed DS2s.

The M13 supports numerous automatic monitoring functions. It can provide an interrupt to the control system or it can be operated in a polled mode.

Complies with T1.102, T1.107, T1.231, T1.403, T1.404, GR-499, G.747, and G.775.

### 2.12.1 Receive Direction

The receive DS3 is monitored for loss of clock and checked for loss of signal (LOS) according to T1.231. The B3ZS decoder accepts either unipolar clock and data or unipolar clock, positive and negative data. It also checks for bipolar coding violations. The transmit DS3 can be looped back into the receive side after B3ZS decoding. The M23 demultiplexer checks for valid DS3 framing by finding the frame alignment pattern (F bits), and then locating the multiframe alignment signal (M bits). During each M frame, the data stream is checked for the presence of the AIS (1010) or idle (1100) pattern.

C bits 13, 14, and 15 can be used as a 28.2 kbits/s data link and are available directly at device output via an internal HDLC receiver. The receiver is composed of a 128-byte FIFO, a CRC-16 frame check sequence (FCS) error detector, and control circuits.

Within the M23 demultiplexer, there are four performance monitoring counters for F- or M-bit, P-bit, E-bit parity, and FEBE errors. Each M12 demultiplexer contains two performance monitoring counters.

### 2.12.2 Transmit Direction

The incoming DS1/E1 clocks are first checked for activity or loss of clock (LOC). The data signals are retimed and checked for AIS and activity. DS1/E1 loopback selectors allow DS1 or E1 received within the DS2 or DS3 inputs from the deMUX path to be looped back. This loopback can be performed automatically or the user can force a DS1 or E1 loopback.

The four DS1 or three E1 signals for each M12 MUX are fed into single-bit, 16-word-deep FIFOs to synchronize the signals to the DS2 frame generation clock. The fill level of each FIFO determines the need for bit stuffing its DS1/E1 input. The M13 can handle DS1/E1 signals with nominal frequency offsets of  $\pm 130$  ppm and up to five unit intervals peak jitter. The DS2/DS3 transmit clock is used to derive the clock source for DS2 frame generation.

The M23 multiplexer generates a transmit DS3 frame, and fills the information bits in the frame with data from the seven DS2 select blocks. The M23 MUX can be provisioned to operate in either the M23 mode or the C-bit parity mode. It contains seven DS2 FIFOs each with a depth of 8. The fill level of each FIFO determines the need for bit stuffing its DS2 input.

The transmit DS3 output can either be in the form of unipolar clock and data or unipolar clock, positive and negative data. The DS3 data is B3ZS encoded and can be looped back from the receive DS3 input.

## 2.13 E13/E23 Multiplexer

The information on the E13/E23 multiplexer is not available at this time.

## 2 The SONET/SDH Ultramapper (continued)

### 2.14 Cross Connect Block

The cross connect (XC) is a highly configurable nonblocking crosspoint switch for DS1/E1/DS2 signals, configuration of DS3 signal paths, and configuration of the path overhead access I/O. The cross connect plays a major role in configuring the interconnection of major function blocks to satisfy an application's implementation.

The cross connect provides the flexibility to tie DS1/E1/DS2 channels from the framer or external pins to the M13 mapper or to the VT mapper. It is also capable of multicast or broadcast operation (one port to many), handling injected test patterns, idles, or alarm conditions to any channel, and can provide system loopback testing support. Jitter attenuation may also be inserted in-line on any DS1/E1 channel.

The cross connect can interconnect up to 84 individual DS1/E1 channels between the framer, M13 multiplexer, VT mapper, jitter attenuator, or external I/O. The external I/O pins support an application dependent mix of up to 29 T1/E1 interfaces (one dedicated protection channel), seven DS2 interfaces, or one of four available framer system interfaces.

The cross connect supports an independent signal path for remote alarm indication (RAI), alarm indication signal (AIS), and byte-synchronous frame synchronizing signals on channels between the VT mapper or M13 and the framer. Receive pointer adjustment information is routed to the jitter attenuator block for each channel originating in the VT mapper.

The cross connect has independent DS2 interfaces for the M12 and M23 blocks of the M13 MUX. Full split access to the external I/O device pins provides the capability to add, drop, or rearrange the DS2 signals within the M13.

For DS3 signals, the cross connect supports configuration of interconnects between the M13 and the SPE, or external I/O interconnection to the M13 or SPE, or insertion/monitoring of DS3 test patterns from the test-pattern generator block.

The test-pattern generator block (TPG) provides test signals and monitors inputs (TPM) for signals to and from the cross connect. The TPG can generate a set of test signals or idles at DS1, E1, DS2, or DS3 rates. There is only one test pattern generator and monitor per signal rate.

Device pins for the path overhead access channel may be configured to connect to the SPE mapper or TMUX blocks.

### 2.15 DS1 Digital Jitter Attenuator

The digital jitter attenuator (DJA) contains 28 copies of the digital jitter attenuator block. These digital jitter attenuator blocks can operate in two different modes, as a DS1 or as an E1 jitter attenuator.

In both modes, the digital jitter attenuator can be provisioned to always operate as a second-order PLL, or it can switch to act as a first-order PLL during VT pointer adjustments to help meet MTIE requirements. The period of time in the first-order mode is provisionable. The PLL bandwidth is provisionable between 0.1 Hz and 0.5 Hz, and the damping factor for these bandwidths varies between 2 and 0.5 to accommodate a number of different system constraints.

The block will also insert the proper AIS signal if the primary block AIS control input is active.

### 2.16 DS3 Digital Jitter Attenuator

The information on the DS3 digital jitter attenuator is not available at this time.

## 2 The SONET/SDH Ultramapper (continued)

### 2.17 Test Pattern Generator

The test pattern generator and monitor (TPG and TPM) is a set of configurable test pattern generators and monitors for local self-test, maintenance, and troubleshooting operations.

The TPG feeds one or more T1/E1/DS2 test signals (via data, clock, and FS or AIS signal paths) to the crosspoint switch which can redistribute or broadcast these signals to any valid channel in the framer, external I/O, M13 mapper, or VT mapper blocks. The TPG can also generate DS3 test signals.

Any channel arriving at the cross connect may be routed to the test monitor. The test monitors can automatically detect/count bit errors in a pseudorandom test sequence, loss of frame, or loss of synchronization. The TPM can provide an interrupt to the control system or it can be operated in a polled mode.

Simultaneous testing of DS1, E1, DS2, and DS3 signals is supported (one channel each).

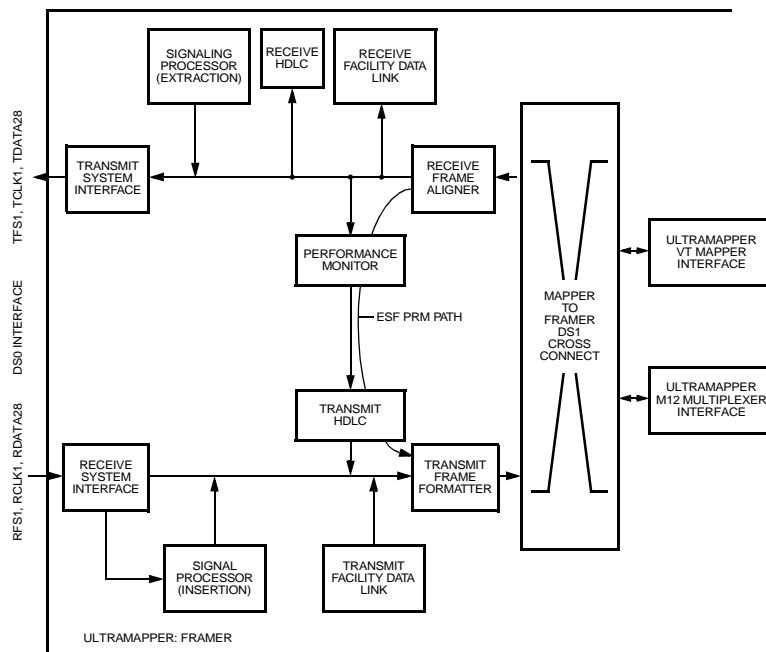

Supported test patterns are: pseudorandom bit sequence (PRBS15, PRBS20), alternating zeros/ones, and an all-ones pattern.

The test pattern can be transmitted either unframed or as the payload of a framed signal, as defined in ITU-T Recommendation O.150.

Single bit-errors may be injected into any test pattern, under register control.

### 2.18 28-Channel Framer

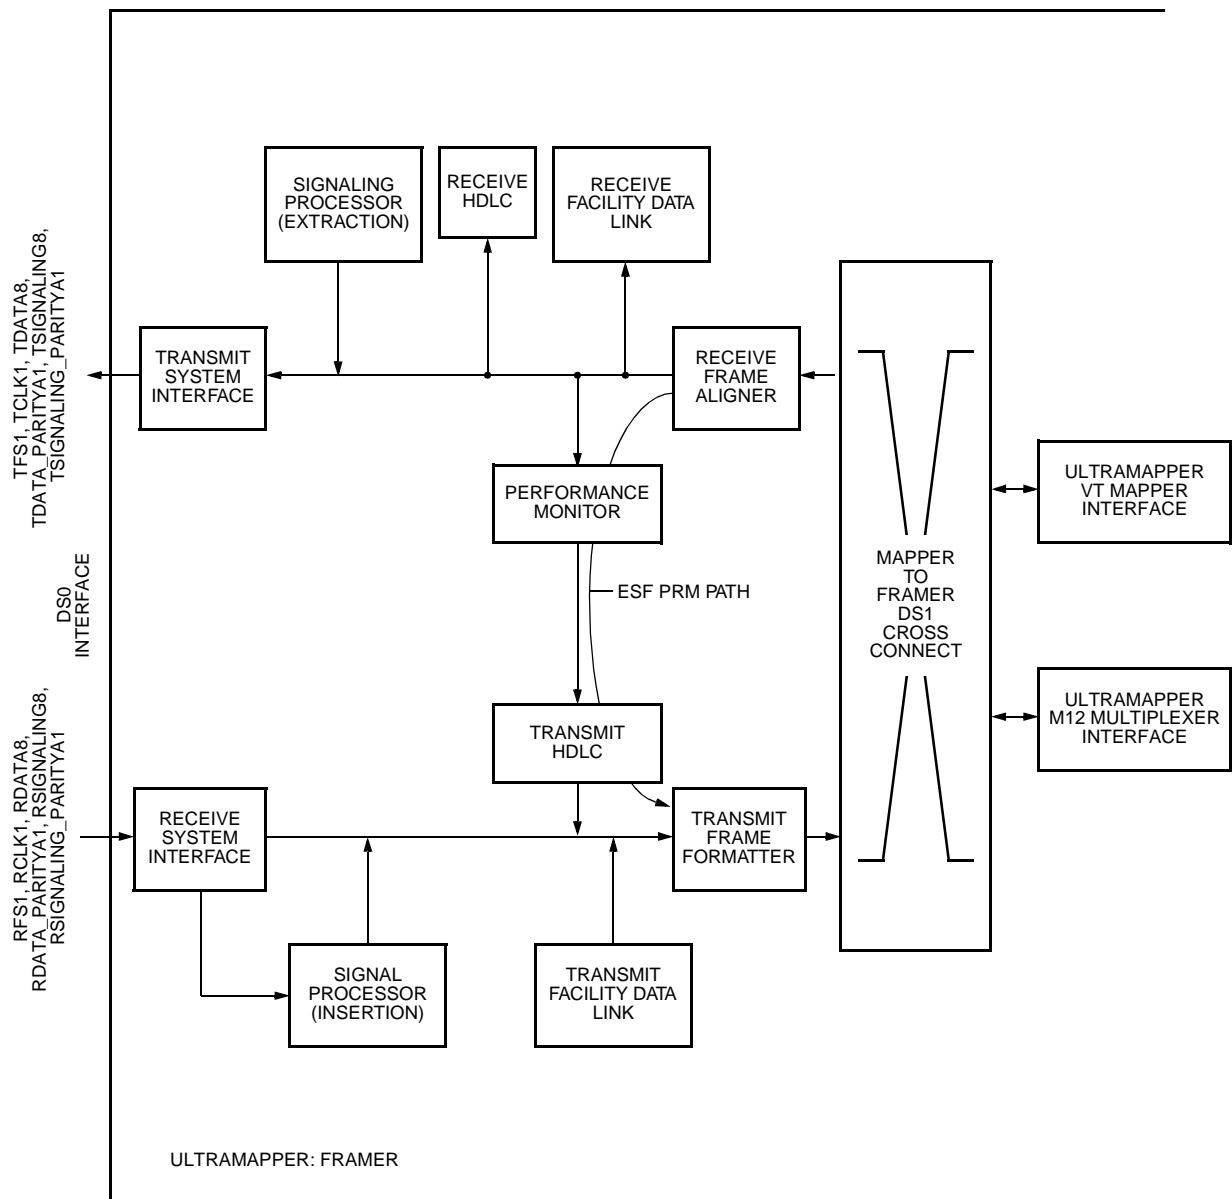

The block diagrams of the 84 T1/63E1-channel framer in the switching application in the CHI, parallel system bus, and CHI with byte-synchronous VT mapping, are shown in Figure 10, Figure 11, and Figure 12 (only the major functional blocks are shown). The block diagrams of the 84 T1/63E1-channel framers in the transport application are shown in Figure 13 and Figure 14 (only the major functional blocks are shown).

Figure 10. Ultramapper Switching Mode for Framer in Concentration Highway Interface (CHI) Configuration

2 The SONET/SDH Ultramapper (continued)

5-8927.a (F)

Figure 11. Ultramapper Switching Mode for Framer in Parallel System Bus Configuration

2 The SONET/SDH Ultramapper (continued)

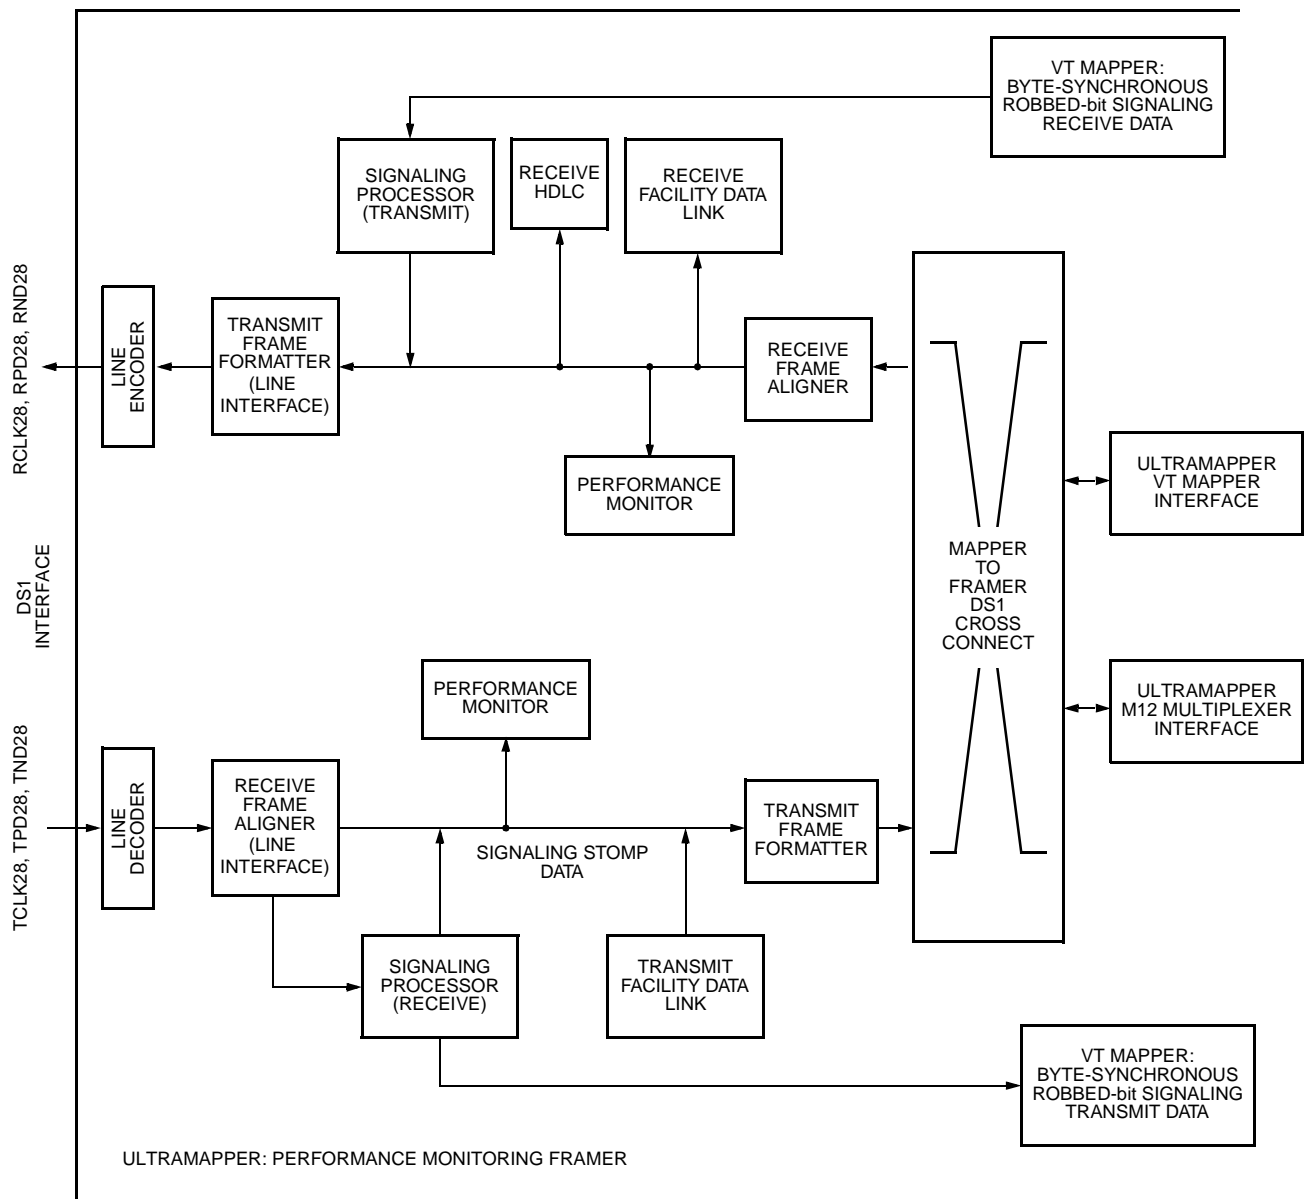

In the byte-synchronization mode, the frame synchronization and signaling (VT SPE) information are also passed to the mapper. In the receive direction, the mapper block provides the line data, line clock, frame synchronization (byte-synchronization mode), and signaling information (byte-synchronization mode) to the Ultra Framer. Performance reports, in the form of HDLC packets (PRMs), are sent from the receive performance monitor block to the transmit HDLC block.

## 2 The SONET/SDH Ultramapper (continued)

### 2.19 Line Decoder/Encoder

- The line decoder/encoder supports either single-rail or dual-rail transmission. In dual-rail mode, the line codes supported are as follows.
- Alternate mark inversion (AMI).
- DS1 binary 8 zero code suppression (B8ZS).
- ITU-CEPT high-density bipolar of order 3 (HDB3).

In the single-rail mode, a line interface unit (LIU) decodes/encodes the data.

In the dual-rail mode, loss of signal is monitored.

In the case of coded mark inversion (CMI) coding (Japanese TTC standard JJ-20.11), the LIU decodes the data, indicating both the CMI coding rule violations (CRVs) and line coding violations as bipolar violations. (In the CMI mode, the framer is in the single-rail mode.)

### 2.20 Receive Frame Aligner/Transmit Frame Formatter

The receive frame aligner and transmit frame formatter support the following frame formats:

- D4 Ultraframe.
- SF D4 Ultraframe: F<sub>T</sub> framing only.
- J-D4 Ultraframe with Japanese remote alarm.
- DDS.
- SLC-96.
- ESF.
- J-ESF (J1 standard with different CRC-6 algorithm).
- Nonalign DS1 (193 bits—clear channel).
- CEPT basic frame (ITU G.706).
- CEPT CRC-4 multiframe with 100 ms timer (ITU G.706).
- CEPT CRC-4 multiframe with 400 ms timer (automatic CRC-4/non-CRC-4 equipment interworking) (ITU G.706 Annex B).
- Nonalign E1 (256 bits—clear channel).
- 2.048 coded mark inversion (CMI) coded interface (TTC standards JJ-20.11).

#### 2.20.1 Receive Performance Monitor

The receive framer monitors the following alarms: loss of receive clock, loss of signal, loss of frame, alarm indication signal (AIS), remote frame alarms, and remote multiframe alarms. These alarms are detected as defined by the appropriate ANSI, AT&T, ITU, and ETSI standards.

Performance monitoring as specified by AT&T, ANSI, and ITU is provided through counters monitoring bipolar violation, frame bit errors, CRC errors, errored events, errored seconds, bursty errored seconds, and severely errored seconds.

In-band loopback activation and deactivation codes can be transmitted to the line via the payload or the facility data link. In-band loopback activation and deactivation codes in the payload or the facility data link are detected.

## 2 The SONET/SDH Ultramapper (continued)

### 2.21 Signaling Processor

The signaling processor supports the following modes:

- Ultraframe (D4, SLC-96): 2-state, 4-state, and 16-state.
- VT 1.5 SPE: 2-state, 4-state, and 16-state.
- Extended Ultraframe: 2-state, 4-state, and 16-state.
- CEPT: common channel signaling (CCS) (TS-16).
- Transparent (pass through) signaling.
- J-ESF handling groups.

Signaling features supported per channel are as follows:

- Signaling debounce.
- Signaling freeze.
- Signaling interrupt upon change of state.
- Associated signaling mode (ASM).
- Signaling inhibit.
- Signaling stomp.

In the DS1 robbed-bit signaling modes and voice and data channels are programmable. The entire payload can be forced into a data-only (no signaling channels) mode, i.e., transparent mode by programming one control bit.

Signaling access can be through the on-chip signaling registers or the system interface. Data and its associated signaling information can be accessed through the system in either DS1 or CEPT-E1 modes.

### 2.22 Facility Data Link (FDL) Processor

The bit-oriented ESF data-link messages defined in *ANSI/T1.403* are monitored by the receive facility data link unit. The transmit facility data link unit overrides the FDL-FIFO for the transmission of the bit-oriented ESF data-link messages defined in *ANSI/T1.403-1995*.

The FDL processor extracts and stores data link bits from three different frame types as follows:

- D bits and delineator bits from the SLC-96 multi-Ultraframe.
- Data link bits from DDS frames (bit 6 of time-slot 24).
- Two multiframes of Sa[4:8] bits from time slot 0 in CEPT basic and CRC-4 multiframes.

The respective bits will always be extracted from frame-aligned frames and stored in a stack. The processor will have control of being alerted to stack updates through the interrupt mask registers.

The transmit FDL block performs the transmission of D bits into SLC-96 Ultraframes, Sa-bits in CEPT frames, and D bits in DDS frames.

- In SLC-96 frames, the D and delineator-bits are always sourced from this block when the block is enabled for insertion.
- In DDS frames, the data link bits are always sourced from this block when this block is enabled for insertion. This block also provides the capability to transmit BOMs in the data link channel of ESF links.
- In CEPT frames, the Sa-bits are sourced from either the Sa stack within this block or from the system interface. The data link block only responds with valid data when selected by the Sa source control bits.

## 2 The SONET/SDH Ultramapper (continued)

### 2.23 HDLC Unit

The HDLC processor formats the HDLC packets for insertion into the programmable channels. A channel can be any number of bits (1 to 8) from a time slot.

The maximum number of channels is 64. The maximum channel bit rate is 64 kbits/s. The minimum channel bit rate is 4 kbits/s. Each channel is allocated 128 bytes of storage.

HDLC processing of data on the facility data link (PRMs, Sa bits, or otherwise) is implemented by assigning the FDL bit position to a logic HDLC channel.

### 2.24 System Interface and Transport Modes

The system interface block provides a programmable interface. It can be configured to work in the following four different modes:

- Concentration highway interface (serial time division multiplex interface):
  - Global frame synchronization.
  - Global clock: 2.048 MHz, 4.096 MHz, 8.192 MHz, or 16.384 MHz.
  - 84 transmit and receive data ports; data rates 2.048 Mbits/s, 4.096 Mbits/s, 8.192 Mbits/s, or 16.384 Mbits/s.
- Parallel system bus (parallel time-division multiplex interface/transmit and receive):
  - Global frame synchronization.
  - Global clock: 19 MHz.
  - Data rate: 19 MHz.
  - 8 bits of data + associated parity bit.
  - 4 bits of signaling + 2 bits of signaling control + 1 bit of parity.
- Time-division multiplex data rate serial interface:
  - 28 receive frame synchronization (per port).
  - 28 receive clock: 1.544 Mbits/s or 2.048 Mbits/s (per port).
  - 28 receive ports.
  - One transmit frame synchronization.
  - One transmit clock: 1.544 Mbits/s or 2.048 Mbits/s.
  - 28 transmit ports.
- Network serial multiplexed bus:
  - 6- or 8-pin serial interface.
  - Transmit and receive clock and data at 51.84 MHz.
  - Accommodates one DS3 of throughput.
  - Provides a minimal pin count interface for data and inverse multiplexing for ATM (IMA) applications without slip buffers.
  - Three modes of operation:
    - Framer—NSMI payload assembled/disassembled into DS1/E1s.
    - M13—proprietary transport format with DS3 framing.
    - SPE—proprietary transport format mapped into an STS-1/AU-3.

3 Pin Information

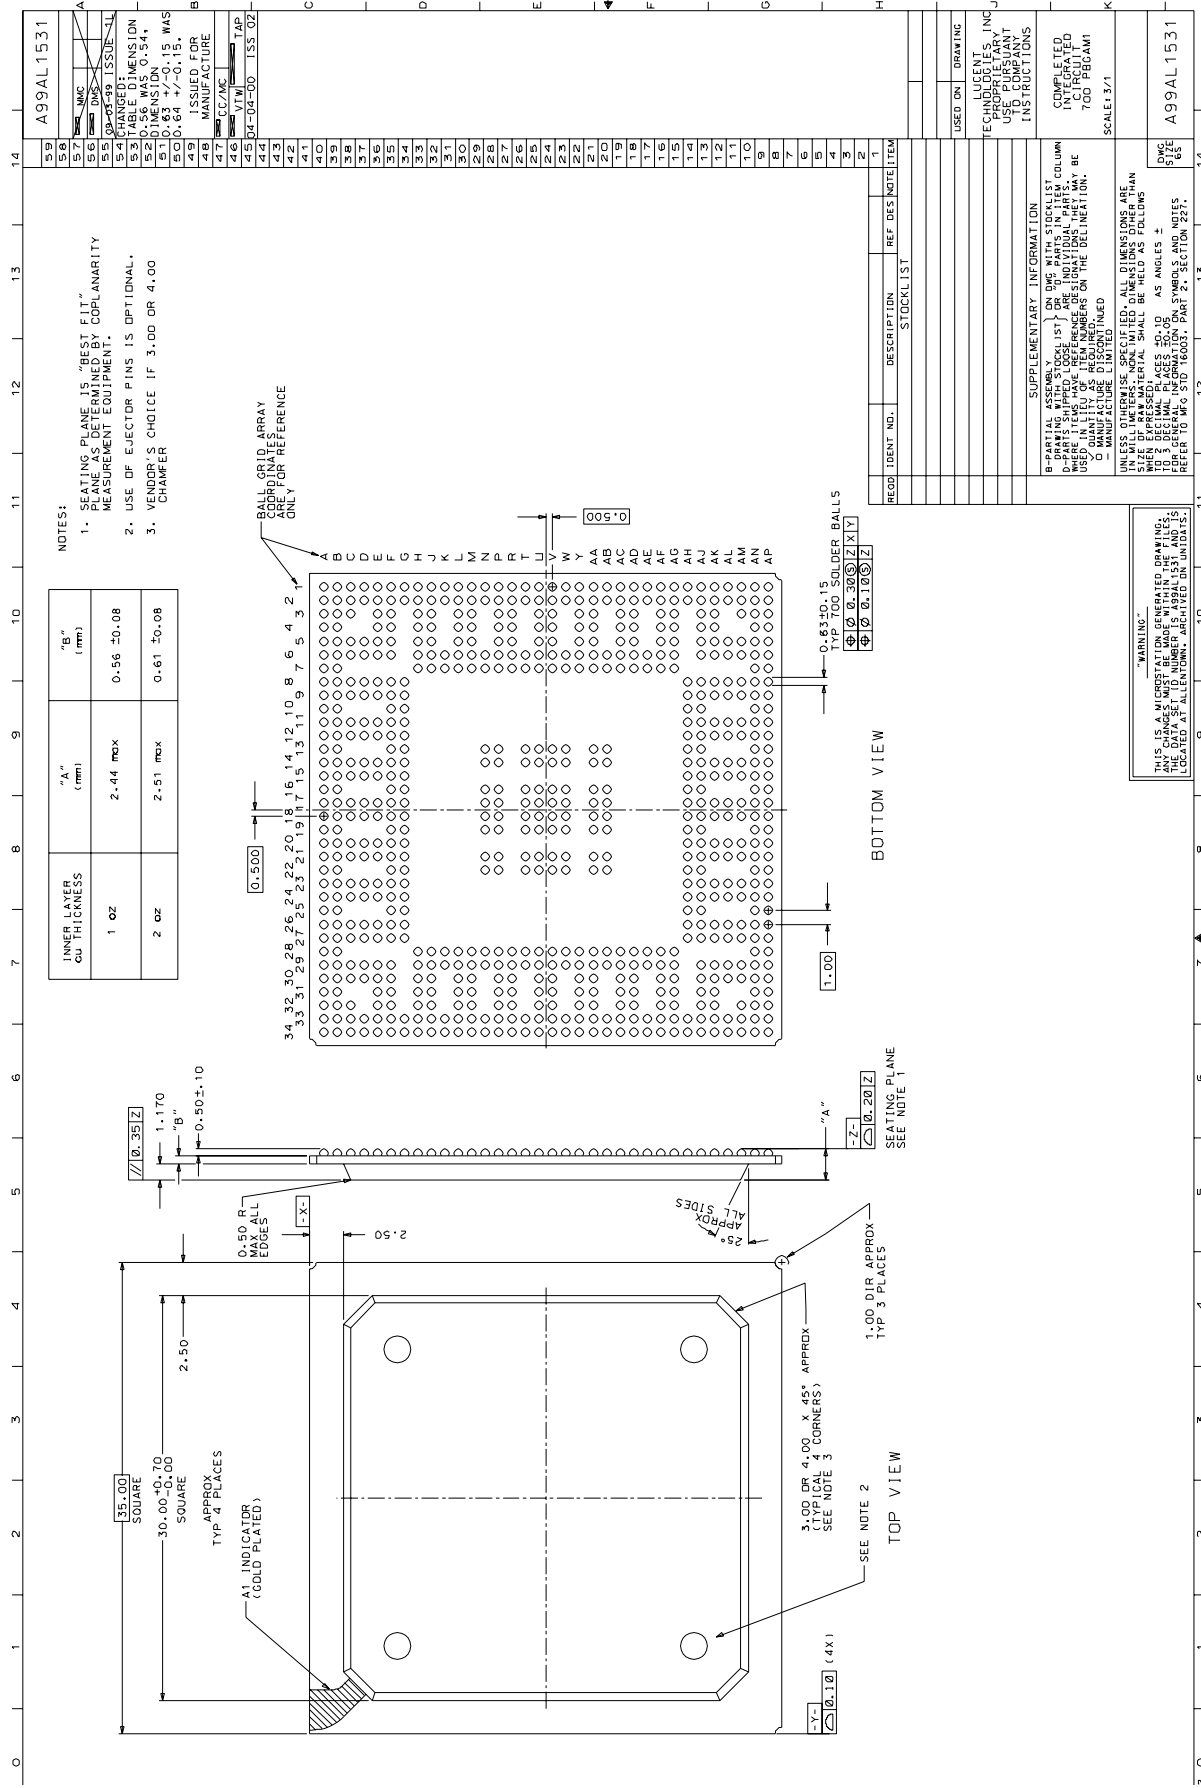

Figure 15. 700 Pin PBGA

### 3 Pin Information (continued)

#### 3.1 Introduction

Table 1 lists pin descriptions including the pin, symbol (or signal name), type, I/O, and description. Table 2, starting on page 44, lists just the pin and symbol, sorted by pin number order. Table 3, starting on page 52, lists pins and symbol names, sorted by symbol name order.

**Table 1. Pin Descriptions**

Pin	Symbol	Type	I/O*	Description
<b>TMUX Block</b>				
<b>High-Speed Receive I/O (4)</b>				
AM5	RHSDP	LVDS	I	<b>622/155 Mb/s STS-12/STS-3 Input Data.</b> Input for optional clock and data recovery (CDR). LVDS input.
AM6	RHSDN			
AN4	RHSCP	LVDS	I	<b>155 MHz Clock for STS-3 Input Data.</b> LVDS input.
AN5	RHSCN			
<b>High-Speed Transmit I/O (7)</b>				
AP6	THSCP	LVDS	I	<b>Transmit 622/155 MHz Clock and Reference Clock for CDR (optional).</b> LVDS input.
AP7	THSCN			
AP4	THSCOP	LVDS	O	<b>Output 622/155 MHz Clock.</b> LVDS output.
AP5	THSCON			
AL15	THSSYNC	—	I/O	<b>Transmit 8K Frame Sync for STS-12/STM-4, or STS-3/STM-1 Mode.</b> If the register MPU_MASTER_SLAVE= 1, THSSYNC is an output, otherwise, THSSYNC is an input.
AN7	THSDP	LVDS	O	<b>Transmit Output Data for STS-12, STM-4, or STS-3 Mode.</b> LVDS output.
AN8	THSDN			
<b>Protection Switch I/O (8)</b>				
AM8	RPSDP	LVDS	I	<b>Receive Side 622/155 Mb/s Serial Data Input from Protection Board.</b>
AM9	RPSDN			
AN10	RPSCP	LVDS	I	<b>Receive Side 155 MHz Clock Input from Protection Board.</b>
AN11	RPSCN			
AP10	TPSDP	LVDS	O	<b>Transmit Side 622/155 Mb/s Serial Data Output to Protection Board.</b>
AP11	TPSDN			
AP8	TPSCP	LVDS	O	<b>Transmit Side 622/155 MHz Clock Output to Protection Board.</b>
AP9	TPSCN			

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>TMUX Block (continued)</b>				
<b>STS3/STM1 Mate Interconnect (14)</b>				
AP17, AP15, AP13	RLSDATAP[3:1]	LVDS	O	<b>155 Mbit/s STS-3/STM-1 Output Data.</b> LVDS output.
AP18, AP16, AP14	RLSDATAN[3:1]			
AN17, AN15, AN13	TLSDATAP[3:1]	LVDS	I	<b>155 Mbit/s STS-3/STM-1 Input Data.</b> Input for clock and Data Recovery (CDR). LVDS input.
AN18, AN16, AN14	TLSDATAN[3:1]			
AK15	RLSCLK	—	O	<b>19.44 MHz Receive Side Byte CLK.</b>
AL14	TLSCCLK	—	O	<b>19.44 MHz Transmit Side Byte CLK.</b>
<b>LVDS Control Pins (8)</b>				
AP3	RESHI	—	I	<b>External 100 Ω Resistor Pin 1.</b> <b>Note:</b> A 100 W 1% resistor is required between RESHI and RESLO pins as a reference for the LVDS input buffer termination.
AJ8	RESLO	—	I	<b>External 100 Ω Resistor Pin 2.</b> See note in RESHI pin.
AJ6	REF10	—	I	<b>External 1 V Reference Voltage Pin.</b>
AK6	REF14	—	I	<b>External 1.4 V Reference Voltage Pin.</b>
AK8	CTAPRH	—	—	<b>LVDS Buffer Terminator Center Tap for RHSDP/N and RHSCP/N.</b> Optional, 0.1 μF capacitor connected between CTAP pin and ground, to improve the common mode rejection of the LVDS input buffers.
AJ9	CTAPTH	—	—	<b>LVDS Buffer Terminator Center Tap for THSCP/N and THSSYNPN/N.</b> Optional, 0.1 μF capacitor connected between CTAP pin and ground, to improve the common mode rejection of the LVDS input buffers.
AK9	CTAPRP	—	—	<b>LVDS Buffer Terminator Center Tap for RPSDP/N and RPSCP/N.</b> Optional, 0.1 μF capacitor connected between CTAP pin and ground, to improve the common mode rejection of the LVDS input buffers.
AJ13	CTAPTL	—	—	<b>LVDS Buffer Terminator Center Tap for TLSDATAP/N.</b> Optional, 0.1 μF capacitor connected between CTAP pin and ground, to improve the common mode rejection of the LVDS input buffers.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>TMUX Block (continued)</b>				
<b>TOAC Input and Output Channels (6)</b>				
AM17	RTOACCLK	—	O	Receive Side Serial Access Channel Clock Output for the Transport Overhead Bytes.
AJ17	RTOACDATA	—	O	Receive Side Serial Access Channel Data Output for the Transport Overhead Bytes.
AM18	RTOACSYNC	—	O	Receive Side Sync Output for TOAC Channel. Active-high during the LSB of the last byte.
AL18	TTOACCLK	—	O	Transmit Side Serial Access Channel Clock Output for the Transport Overhead Bytes.
AP19	TTOACDATA	—	I <sup>D</sup>	Transmit Side Serial Access Channel Data Input for the Transport Overhead Bytes.
AK18	TTOACSYNC	—	O	Transmit Side Sync Output for TOAC Channel. Active-high during the LSB of the last byte.
<b>POAC Input and Output Channels (6)</b>				
AN19	RPOACCLK	—	O	Receive Side Serial Access Channel Clock Output for the Path Overhead Bytes. This pin can be individually 3-stated.
AJ18	RPOACDATA	—	O	Receive Side Serial Access Channel Data Output for the Path Overhead Bytes. This pin can be individually 3-stated.
AP20	RPOACSYNC	—	O	Receive Side Sync Output for POAC Channel. Active-high during the LSB of the last byte. This pin can be individually 3-stated.
AN20	TPOACCLK	—	O	Transmit Side Serial Access Channel Clock Output for the Path Overhead Bytes. This pin can be individually 3-stated.
AJ19	TPOACDATA	—	I <sup>D</sup>	Transmit Side Serial Access Channel Data Input for the Path Overhead Bytes.
AM20	TPOACSYNC	—	O	Transmit Side Sync Output for POAC Channel. Active-high during the LSB of the last byte. This pin can be individually 3-stated.
<b>Miscellaneous Signals (2)</b>				
AN21	LOSEXT	—	I <sup>U</sup>	External Loss of Signal Input.
AJ20	RHSFSYCN	—	O	Receive Side Frame Sync Output Indicating the Frame Location of the High-Speed Data Input.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>SPE Mapper Block</b>				
<b>External PLL Control (12)</b>				
AL1, AJ2, AH2, AF5, AE6, AG2	PHASEDETUP[6:1]	—	O	<b>Phase Detector Up Signal Out to External PLL Circuit if SPEMPR Outputs DS3/E3 Data Without Going Through Internal DS3/E3DJA.</b> If TSTMODE is high, these pin used for TSTMUX[5:0] (test mode output).
AJ3, AJ1, AK1, AF6, AG5, AG3	PHASEDETDOWN[6:1]	—	O	<b>Phase Detector Down Signal Out to External PLL Circuit if SPEMPR outputs DS3/E3 Data Without Going Through Internal DS3/E3DJA.</b> If TSTMODE is high, PHASEDETDOWN[4-1] used for TSTMUX[9:6] (test mode output).
<b>Multirate Cross Connect Block</b>				
<b>DS3/E3/STS1 Output (24)</b>				
AF2, AD5, AE1, AD1, AA5, AB2	DS3POSDATAOUT[6:1] ]	—	O	<b>Serial DS3/E3/STS1 Positive Data Out to External Circuit.</b>
AF3, AC6, AF1, AD2, AA6, AB1	DS3NEGDATAOUT[6:1] ]	—	O	<b>Serial DS3/E3 Negative Data Out to External Circuit.</b>
AD6, AG1, AD3, AC3, AC2, Y6	DS3DATAOUTCLK[6:1]	—	I <sup>D</sup>	<b>44.736 MHz DS3/34.368 MHz E3/51.84 MHz STS1 Clock in from External Circuit.</b>
AH1, AE2, AC5, AB6, AC1, AA3	DS3RXCLKOUT[6:1]	—	O	<b>44.736 MHz DS3/34.368 MHz E3/51.84 MHz STS1 CLOCK out to External Circuit.</b>
<b>DS3/E3/STS1 Input (18)</b>				
AA1, Y2, W6, V3, U3, T2	DS3POSDATAIN[6:1]	—	I <sup>D</sup>	<b>Serial DS3/E3/STS1 Positive Data from External Device.</b>
AA2, Y1, V6, V5, U2, T1	DS3NEGDATAIN[6:1]	—	I <sup>D</sup>	<b>Serial DS3/E3 Negative Data or Bipolar Violation Input from External Device.</b>
Y5, Y3, W2, W1, V2, U5	DS3DATAINCLK[6:1]	—	I <sup>D</sup>	<b>44.736 MHz DS3/34.368 MHz E3/51.84 MHz STS1 Clock In from External Device.</b>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>Multifunction System Interface</b>				
<b>Note:</b> Pin functional descriptions are representative configurations. Configuration is limited by the I/O definition and the flexibility of the internal cross-connect.				
<b>LINE Transmit Path Direction (60)<sup>†</sup></b>				
A3, F8, B5, A4, B6, B7, E9, F10, B8, A7, B9, E11, B10, E12, A10, F13, A11, F14, E14, C14, F15, E15, C15, B15, F17, A16, C17, B18, E18, B19	LINERXDATA[30:1]	—	I <sup>D</sup>	<p><b>Configurable Inputs to the Internal Cross Connect.</b></p> <p>Transport Modes: Framer—LIU: Received positive-rail or single-rail DS1/E1 line data input (sourced from an external LIU).</p> <p>M12 or E12: Normally used as receive DS1/E1 data input. If DS1/E1's come from internal source, these pins may also be used as DS2/E2 inputs.</p> <p>VT Mapper: Receive DS1/E1/VC data input.</p> <p>M23 or E23: Receive DS2/E2 data input. Up to 21 DS2/12 E2 signals may be assigned to any of the 30 LINERXDATA inputs.</p>
E6, B4, C5, C6, E8, A5, F9, A6, C8, F11, C9, A8, F12, A9, C11, B11, C12, B12, A12, B13, A13, B14, A14, F16, A15, B16, E17, B17, C18, A19	LINERXCLK[30:1]	—	I/O <sup>D</sup>	<p><b>Configurable Inputs to the Internal Cross Connect.</b></p> <p>Transport Modes: Framer—LIU: Receive DS1/E1 line clock input</p> <p>M12 or E12: Normally used as receive DS1/E1 line clock input (unless for demand clocking mode in which they are used as clock outputs). If DS1/E1 signals come from internal source, these pins may carry DS2/E2 clk input.</p> <p>VT Mapper: Receive DS1/E1/VC line clock input</p> <p>M23 or E23: Receive DS2/E2 clock input/output. Up to 21 DS2/12 E2 signals may be assigned to any of the 30 LINERXCLK inputs.</p>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

† Transmit path convention is toward the high-speed fiber output. Note that LINERX signals are labeled Receive, as seen from the cross connect perspective.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>Multi-Function System Interface (continued)</b>

AA34	CHITXGFS	—	I	<p><b>CHI:</b> Transmit system frame sync input.</p> <p>Parallel system bus: Transmit system frame sync input.</p>
Y30	CHITXGCLK	—	I	<p><b>Switching Modes:</b> CHI: Transmit global system clock input (4.096 MHz, 8.192 MHz, or 16.384 MHz).</p> <p>Parallel system bus: Transmit global clock input (19.44 MHz).</p>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down, I<sup>U</sup> indicates internal pull-up.

† Receive path convention is away from the high-speed fiber output. Note that CHITX signals are labeled Transmit, as seen from the cross connect perspective.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>NSMI Transmit Path Direction (12)<sup>†</sup></b>				
AP28, AK24, AK23	NSMIRXDATA[3:1]	—	I	<b>NSMI Receive Data Inputs or STS-1 Receive Data Inputs for STS1LTs.</b>
AJ24, AP27, AP26	NSMIRXCLK[3:1]	—	I/O	<b>NSMI Receive Clock Input (51.84 MHz) for FRM or Transmit Clock Output for M13 or SPE.</b> These pins can also carry STS-1 Rx clock inputs for STS1LTs.
AN27, AN26, AN25	NSMIRXSYNC[3:1]	—	I/O	<b>NSMI Receive System Frame Sync Input for FRM or Transmit Control Signal for M13 or SPE.</b> They may also carry STS-1 transmit clock inputs for STS1LTs.
AM27, AM26, AJ23	RXDATAEN[3:1]	—	O	<b>Receive Data Enable for NSMI Mode.</b>
<b>NSMI Receive Path Direction (12)<sup>‡</sup></b>				
AP31, AN28, AJ25	NSMITXDATA[3:1]	—	O	<b>NSMI Transmit Data Outputs or STS-1 Tx Data Outputs from STS1LTs.</b>
AM29, AP30, AP29	NSMITXCLK[3:1]	—	O	<b>NSMI Transmit Clock Output or STS-1 Tx Clock Outputs from STS1LTs.</b>
AN30, AN29, AK26	NSMITXSYNC[3:1]	—	O	<b>Transmit System Frame Sync Output.</b>
AM30, AK27, AJ26	TXDATAEN[3:1]	—	O	<b>Transmit Data Enable for NSMI Mode.</b>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

† Transmit path convention is toward the high-speed fiber output. Note that CHIRX signals are labeled Receive, as seen from the cross connect perspective.

‡ Receive path convention is away from the high-speed fiber output. Note that CHITX signals are labeled Transmit, as seen from the cross connect perspective.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>M13/E13 Mux/DeMUX Block</b>				
<b>Receive (DeMUX) Direction (6)</b>				
AP21	E1XCLK	—	I <sup>D</sup>	<b>E1 X Clock.</b> This clock signal is used to generate E1 AIS (all 1s). It must be 2.048 MHz ± 50 ppm, or x16, x32 of 2.048 MHz.
AK20	DS1XCLK	—	I <sup>D</sup>	<b>DS1 X Clock.</b> This clock signal is used to generate DS1 AIS (all 1s). It must be 1.544 MHz ± 32 ppm, or x16, x32 of 1.544 MHz.
R1	DS2AISCLK	—	I <sup>D</sup>	<b>DS2 AIS Clock.</b> A 6.312 MHz ± 30 ppm clock input used as DS2 AIS clock or DS2 data output clock. <b>VC11 AIS Clock.</b> A 1.664 MHz input. In the VTMPR mode, this clock is used to generate VC11 AIS.
U6	E2AISCLK	—	I <sup>D</sup>	<b>E2 AIS Clock.</b> A 8.448 MHz ± 30 ppm clock input used as E2 AIS clock or E2 data output clock. <b>VC12 AIS Clock.</b> A 2.224 MHz input. In the VTMPR mode, this clock is used to generate VC12 AIS.
A21	DS3XCLK	—	I <sup>D</sup>	<b>DS3 X Clock.</b> A 44.736 MHz ± 20 ppm clock input for DS3 DJA.
F18	E3XCLK	—	I <sup>D</sup>	<b>E3 X Clock.</b> A 34.768 MHz ± 20 ppm clock input for E3 DJA.
<b>VT Mapper Block</b>				
<b>Transmit Direction (3)</b>				
B22	LOPOHCLKIN	—	I <sup>D</sup>	<b>Low-Order Path Overhead Clock.</b>
C21	LOPOHDATAIN	—	I <sup>D</sup>	<b>Low-Order Path Overhead Data (O-Bits, V5, J2, Z6/N2, Z7, and K4 Byte).</b>
A22	LOPOHVALIDIN	—	I <sup>D</sup>	<b>Valid LOPOHDATAIN.</b>
<b>Receive Direction (3)</b>				
F20	LOPOHCLKOUT	—	O	<b>Low-Order Path Overhead Clock.</b>
B21	LOPOHDATAOUT	—	O	<b>Low-Order Path Overhead Data (Line and Path REI and RDI, O-Bits, V5, J2, Z6/N2, and Z7/K4 Byte).</b>
E20	LOPOHVALIDOUT	—	O	<b>Valid LOPOHDATAOut.</b>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>Framer PLL (4)</b>				
AJ32	CLKIN_PLL	—	I <sup>D</sup>	<b>PLL Clock Input.</b>
AL33	CG_PLLCLKOUT	—	O	<b>Clock generation for Framer 3.3 V PLL.</b>
AK30	MODE2_PLL	—	I <sup>D</sup>	<b>PLL Control Input for Mode 2/Testmode Output.</b>
AG29	MODE0_PLL	—	I <sup>D</sup>	<b>PLL Control Input for Mode 0.</b>
AK32	MODE1_PLL	—	I <sup>D</sup>	<b>PLL Control Input for Mode 1.</b>
<b>Microprocessor Interface (49)</b>				
F5	MPCLK	—	I	<b>Synchronous Microprocessor Clock (when MPMODE = 1).</b> The maximum clock frequency is 66 MHz. This clock is required to properly sample address, data, and control signals from the microprocessor in both asynchronous and synchronous modes of operation. This clock must be within the range of 16 MHz to 66 MHz.
F6	MPMODE	—	I	<b>Microprocessor Mode Select.</b> If the microprocessor interface is synchronous, MPMODE should be set to 1. If the microprocessor interface is asynchronous, MPMODE should be set to 0.
C1	CSN	—	I <sup>U</sup>	<b>Chip Select (Active-Low).</b> For synchronous mode, it should be stable beyond a certain setup time before the rising clock edge when ADSN is active. For asynchronous mode, it should be stable before DSN is asserted.
D2	ADSN	—	I	<b>Address Strobe (Active-Low).</b> Active-low address strobe that is a one MPCLK cycle wide pulse for synchronous mode and active for the entire read/write cycle for asynchronous mode. Address bus signals, ADDR(20:0), are transparently latched into Ultramapper when ADSN is low. The address bus should remain valid for the duration of ADSN.
H6	RWN	—	I	<b>Read/Write Cycle Selection.</b> RWN is set high for a read operation, or set low for write operation.
E3	DSN	—	I	<b>Data Strobe (Active-Low).</b> DSN is not used for synchronous mode. For asynchronous mode, write operation, DSN becomes active after data is stable. For read operation, it is similar to ADSN.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>Microprocessor Interface (continued) (49)</b>				
K2, M6, L5, H1, J2, J3, G1, L6, H2, H3, K6, F1, J5, J6, G2, E1, F2, H5, D1, F3, E2	ADDR[20:0]	—	I	<b>21-Bit Address Bus, for 16-Bit Data Bus.</b> The address bus signals are latched transparently when ADSN is low. ADDR20—MSB. ADDR0—LSB.  <b>Note:</b> The Ultramapper is little-endian, the least significant byte is stored in the lowest address and the most significant byte is stored in the highest address. Care must be exercised in connection to microprocessors that use big-endian byte ordering.
R6, N1, P3, N2, P5, M1, P6, M2, L1, M3, N6, L2, K1, L3, M5, J1	DATA[15:0]	—	I/O	<b>16-Bit Data Bus.</b> Device inputs for write operation and outputs for read operation. DATA15—MSB. DATA0—LSB.
R5, P2	PAR[1:0]	—	I/O	<b>Data Parity.</b> Byte-wide parity bits for data. PAR[1] is the parity for DATA[15:8] and PAR[0] is the parity for DATA[7:0].
P1	DTN	—	Open Drain O <sup>1</sup>	<b>Data Transfer Acknowledge.</b> In synchronous microprocessor mode, the delay associated with DTN going low depends on the Ultramapper block being accessed, the address within that block, and the operating mode. In asynchronous microprocessor mode, after qualification of ADSN and DSN by TLSC52 clock, DTN going low depends on the Ultramapper block being accessed, the address within that block, and the operating mode. Under all conditions the user should wait until DTN is asserted before starting the next operation. DTN goes high along with the rising edge of ADSN.
R3	HP_INTN	—	Open Drain O <sup>1</sup>	<b>Ultramapper High Priority Interrupt Request (Active-Low).</b>
T6	LP_INTN	—	Open Drain O <sup>1</sup>	<b>Ultramapper Low Priority Interrupt Request (Active-Low).</b>
R2	APS_INTN	—	Open Drain O <sup>1</sup>	<b>Automatic Protection Switch (APS) Interrupt Request (Active-Low).</b>

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>General Purpose Interface (13)</b>				
AP22	RSTN	—	I <sup>U</sup>	<b>Chip Reset (Active-Low).</b>
AM21	PMRST	—	I/O <sup>D</sup>	<b>Performance Monitor Reset.</b>
AN22	TCK	—	I	<b>JTAG Test Clock.</b> This signal provides timing for test operations.
AK21	TDI	—	I <sup>U</sup>	<b>JTAG Test Data In.</b> JTAG test data input signal, sampled on the rising edge of TCK.
AP23	TMS	—	I <sup>U</sup>	<b>JTAG Test Mode Select.</b> Controls test operations. TMS is sampled on the rising edge of TCK.
AJ21	TRST	—	I <sup>U</sup>	<b>JTAG Test Reset (Active-Low).</b> This signal provides an asynchronous reset.
AN23	TDO	—	O	<b>JTAG Test Data Out.</b> JTAG test data output signal is updated on the falling edge of TCK. The TDO output is 3-stated except when scanning out test data.
AP24	IC3STATEN	—	I <sup>U</sup>	<b>Disable Output Capability of all Bidirectional and 3-State Output Buffers (Active-Low).</b>
AM23	SCK1	—	I <sup>D</sup>	<b>(Test Only.) Scan Clock 1.</b>
AJ22	SCK2	—	I <sup>D</sup>	<b>(Test Only.) Scan Clock 2.</b>
AN24	SCAN_EN	—	I <sup>D</sup>	<b>(Test Only.) Scan Enable (Active-High).</b>
AP25	SCANMODE	—	I <sup>D</sup>	<b>(Test Only.) Serial Scan Input for Testing (Active-High).</b>
AM24	IDDQ	—	I <sup>D</sup>	<b>(Test Only.) IDDQ Input (Active-High).</b>
<b>CDR Interface (7)</b>				
AJ15	BYPASS	—	I <sup>D</sup>	<b>(Test Only.)</b> Enables functional bypassing of the clock synthesis with a test clock. Active-high.
AJ14	TSTPHASE	—	I <sup>D</sup>	<b>(Test Only.)</b> Controls bypass of 32 PLL-generated phases with 32 low-speed phases, generated by test logic. Active-high.
AM15	ECSEL	—	I <sup>D</sup>	<b>(Test Only.)</b> Enables external test control of 155 MHz clock phase selection through ETOGGLE and EXDNUP inputs. Active-high.
AJ16	ETOGGLE	—	I <sup>D</sup>	<b>(Test Only.)</b> Moves 155 MHz clock selection one phase per positive pulse > 20 ns. Active + pulse.
AL17	EXDNUP	—	I <sup>D</sup>	<b>(Test Only.)</b> Direction of phase change. 0 = down; 1 = up.
AK17	TSTMODE	—	I <sup>D</sup>	<b>(Test Only.)</b> Enables test mode for CDR and PLLs.
AM14	TSTSFTLD	—	I <sup>D</sup>	<b>(Test Only.)</b> Enables CDR test mode shift register.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>No Connects</b>				
AK2	NC	—	—	No connect.
AK3	NC	—	—	No connect.
AG6	NC	—	—	No connect.
AL2	NC	—	—	No connect.
AM1	NC	—	—	No connect.
AJ5	NC	—	—	No connect.
AK5	NC	—	—	No connect.
E5	NC	—	—	No connect.
<b>Power And Ground Signals</b>				
<b>CDR 1 &amp; 2 Pins (4)</b>				
AK12	VssA_CDR1	—	I	Analog Vss for CDR 1.
AK11	VDD15A_CDR1	—	I	1.5 V analog VDD for CDR 1.
AJ10	VDD15A_CDR2	—	I	1.5 V analog VDD for CDR 2.
AJ12	VssA_CDR2	—	I	Analog Vss for CDR 2.
<b>X4PLL Pins (2)</b>				
AK14	VDD15A_X4PLL	—	I	1.5 V analog VDD for the times four PLL.
AJ11	VssA_X4PLL	—	I	Analog Vss for the times four PLL.
<b>Framer PLL Pins (2)</b>				
AK33	VDD33A_SFPLL	—	I	Analog 3.3 V VDD for the Framer PLL.
AL34	VssA_SFPLL	—	I	Analog ground for the Framer PLL.
<b>DS3/E3 PLL Pins (4)</b>				
C20	VDD15A_DS3PLL	—	I	1.5 V analog VDD for the DS3 PLL.
F19	VssA_DS3PLL	—	I	Analog Vss for the DS3 PLL.
B20	VDD15A_E3PLL	—	I	1.5 V analog VDD for the E3 PLL.
A20	VssA_E3PLL	—	I	Analog Vss for the E3 PLL.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.

### 3 Pin Information (continued)

Table 1. Pin Descriptions (continued)

Pin	Symbol	Type	I/O*	Description
<b>Common VDD15 Pins (96)</b>				
AA16, AA17, AA18, AA19, AA28, AA7, AB16, AB17, AB18, AB19, AB28, AB7, AC28, AC7, AD28, AD7, AE28, AE7, AF28, AF7, AH10, AH11, AH12, AH13, AH14, AH15, AH16, AH19, AH20, AH21, AH22, AH23, AH24, AH25, AH26, AH9, G10, G11, G12, G13, G14, G15, G16, G19, G20, G21, G22, G23, G24, G25, G26, G9, J28, J7, K28, K7, L28, L7, M28, M7, N16, N17, N18, N19, N28, N7, P16, P17, P18, P19, P28, P7, R28, R7, T13, T14, T21, T22, T28, T7, U13, U14, U21, U22, V13, V14, V21, V22, W13, W14, W21, W28, W7, Y28, Y7, W22	VDD15	—	—	Common power signals for 1.5 V VDD.
<b>Power And Ground Signals (continued)</b>				
<b>Common VDD33 Pins (66)</b>				
A2, A33, AA4, AC31, AD4, AF31, AG28, AG4, AG7, AH17, AH18, AH27, AH8, AJ31, AK4, AL12, AL21, AL24, AL27, AL30, AL6, AL9, AM2, AM33, AN1, AN3, AN32, AN34, AP2, AP33, B1, B3, B32, B34, C2, C33, D11, D14, D17, D20, D23, D26, D29, D5, D8, E31, F4, G17, G18, G27, G8, H28, H31, H7, J4, L31, M4, P31, R4, U28, U31, U7, V28, V4, V7, Y31	VDD33	—	—	Common power signals for 3.3 V VDD.
<b>Common VSS Pins (90)</b>				
A1, A17, A18, A34, AA13, AA14, AA21, AA22, AA31, AB13, AB14, AB21, AB22, AC4, AD31, AF4, AG31, AJ4, AK31, AL11, AL20, AL23, AL26, AL29, AL5, AL8, AM11, AM12, AM3, AM32, AN12, AN2, AN33, AN6, AN9, AP1, AP12, AP34, B2, B33, C3, C32, D12, D15, D18, D21, D24, D27, D30, D6, D9, E4, F31, H4, J31, L4, M31, N13, N14, N21, N22, P13, P14, P21, P22, P4, R31, T16, T17, T18, T19, U1, U16, U17, U18, U19, U34, U4, V1, V16, V17, V18, V19, V31, V34, W16, W17, W18, W19, Y4	VSS	—	—	Common ground signals.

\* O<sup>1</sup> indicates external pull-up recommended (unused or system required),  
I/O<sup>2</sup> indicates external pull-down recommended (unused or system required),  
I<sup>D</sup>; I/O<sup>D</sup> indicate internal pull-down,  
I<sup>U</sup> indicates internal pull-up.
