# October 2000

# 2.3V to 3.6V 256K×16 Intelliwatt<sup>TM</sup> low-power CMOS SRAM with one chip enable

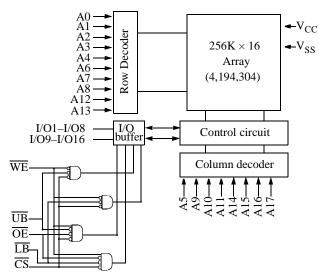

# 'Features

- AS6UA25616
- Intelliwatt<sup>TM</sup> active power circuitry
- Industrial and commercial temperature ranges available
- Organization: 262,144 words x 16 bits
- 2.7V to 3.6V at 55 ns
  2.3V to 2.7V at 70 ns
- Low power consumption: ACTIVE - 114 mW at 3.6V and 55 ns
  - 68 mW at 2.7V and 70 ns

# Logic block diagram

- Low power consumption: STANDBY
- $72 \mu W$  max at 3.6 V
- 41 µW max at 2.7V
- 1.2V data retention
- · Equal access and cycle times
- Easy memory expansion with  $\overline{CS}$ ,  $\overline{OE}$  inputs
- Smallest footprint packages - 48-ball FBGA
- 400-mil 44-pin TSOP II
- ESD protection  $\geq$  2000 volts
- Latch-up current  $\geq 200 \text{ mA}$

#### Functional description

The AS6UA25616 is a low-power CMOS 4,194,304-bit Static Random Access Memory (SRAM) device organized as 262,144 words x 16 bits. It is designed for memory applications where slow data access, low power, and simple interfacing are desired.

Equal address access and cycle times ( $t_{AA}$ ,  $t_{RC}$ ,  $t_{WC}$ ) of 55/70 ns are ideal for low-power applications. Active high and low chip enables ( $\overline{CS}$ ) permit easy memory expansion with multiple-bank memory systems.

When  $\overline{CS}$  is high, or  $\overline{UB}$  and  $\overline{LB}$  are high, the device enters standby mode: the AS6UA25616 is guaranteed not to exceed 72 µW power consumption at 3.6V and 55 ns; 41µW at 2.7V and 70 ns. The device also returns data when V<sub>CC</sub> is reduced to 1.5V for even lower power consumption.

A write cycle is accomplished by asserting write enable ( $\overline{WE}$ ) and chip enable ( $\overline{CS}$ ) low, and  $\overline{UB}$  and/or  $\overline{LB}$  low. Data on the input pins I/O1–O16 is written on the rising edge of  $\overline{WE}$  (write cycle 1) or  $\overline{CS}$  (write cycle 2). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{OE}$ ) or write enable ( $\overline{WE}$ ).

A read cycle is accomplished by asserting output enable  $(\overline{OE})$ , chip enable  $(\overline{CS})$ ,  $\overline{UB}$  and  $\overline{LB}$  low, with write enable  $(\overline{WE})$  high. The chip drives I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive, or write enable is active, or  $(\overline{UB})$  and  $(\overline{LB})$ , output drivers stay in high-impedance mode.

These devices provide multiple center power and ground pins, and separate byte enable controls, allowing individual bytes to bewritten and read.  $\overline{LB}$  controls the lower bits, I/O1–I/O8, and  $\overline{UB}$  controls the higher bits, I/O9–I/O16.

All chip inputs and outputs are CMOS-compatible, and operation is from a single 2.3V to 3.6V supply. Device is available in the JEDEC standard 400-mm, TSOP II, and 48-ball FBGA packages.

#### Absolute maximum ratings

Parameter	Device	Symbol	Min	Max	Unit
Voltage on V <sub>CC</sub> relative to V <sub>SS</sub>		V <sub>tIN</sub>	-0.5	V <sub>CC</sub> + 0.5	V
Voltage on any I/O pin relative to GND		V <sub>tI/O</sub>	-0.5		V
Power dissipation		P <sub>D</sub>	_	1.0	W
Storage temperature (plastic)		T <sub>stg</sub>	-65	+150	°C
Temperature with V <sub>CC</sub> applied		T <sub>bias</sub>	-55	+125	°C
DC output current (low)		I <sub>OUT</sub>	_	20	mA

Note: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

#### Truth table

OUTPUT

Parameters	$V_{CC} = 3.0V$	$V_{CC} = 2.5 V$	$V_{CC} = 2.0 V$	Unit
R1	1105	16670	15294	Ohms
R2	1550	15380	11300	Ohms
R <sub>TH</sub>	645	8000	6500	Ohms
V <sub>TH</sub>	1.75V	1.2V	0.85V	Volts

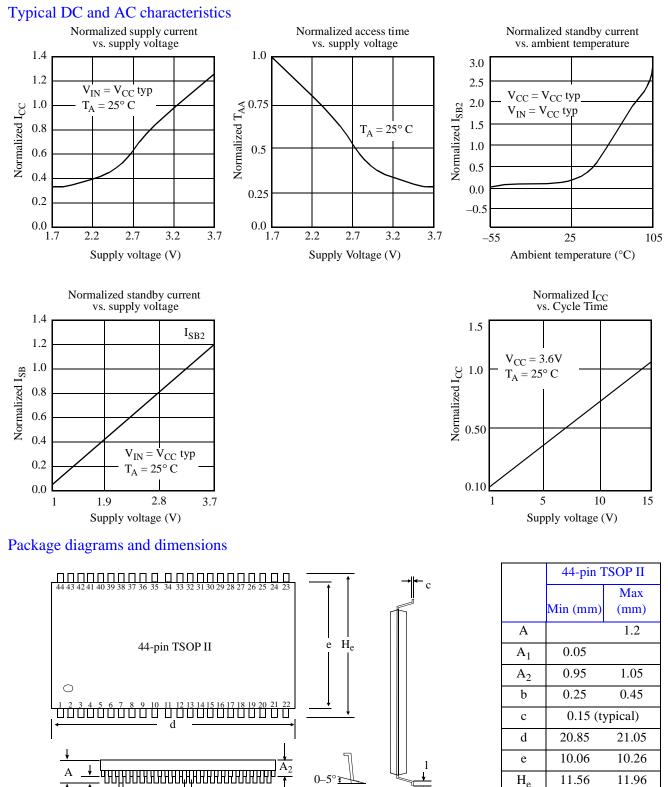

Notes

- 1 During  $V_{CC}$  power-up, a pull-up resistor to  $V_{CC}$  on  $\overline{CS}$  is required to meet  $I_{SB}$  specification.
- 2 This parameter is sampled, but not 100% tested.
- 3 For test conditions, see AC Test Conditions.

4  $t_{CLZ}$  and  $t_{CHZ}$  are specified with  $C_L = 5pF$  as in Figure C. Transition is measured  $\pm 500 \text{ mV}$  from steady-state voltage.

- 5 This parameter is guaranteed, but not tested.
- $\overline{\text{WE}}$  is HIGH for read cycle.
- 7  $\overline{\text{CS}}$  and  $\overline{\text{OE}}$  are LOW for read cycle.
- 8 Address valid prior to or coincident with  $\overline{CS}$  transition LOW.
- 9 All read cycle timings are referenced from the last valid address to the first transitioning address.
- 10  $\overline{CS}$  or  $\overline{WE}$  must be HIGH during address transitions. Either  $\overline{CS}$  or  $\overline{WE}$  asserting high terminates a write cycle.
- 11 All write cycle timings are referenced from the last valid address to the first transitioning address.
- 12 N/A.
- 13 1.2V data retention applies to commercial and industrial temperature range operations.
- 14 C = 30 pF, except at high Z and low Z parameters, where C = 5 pF.
