

3.3V 256K × 16/18 pipeline burst synchronous SRAM

- Organization: 262,144 words × 16 or 18 bits
- Fast clock speeds to 166 MHz in LVTTTL/LVCMOS
- Fast clock to data access: 3.5/3.8/4/5 ns
- Fast \overline{OE} access time: 3.5/3.5/3.8/5.0 ns
- Fully synchronous register-to-register operation
- “Flow-through” mode
- Double-cycle deselect
 - Single-cycle deselect also available (AS7C3256PFS16A/AS7C3256PFS18A)

- Pentium® compatible architecture and timing
- Synchronous and asynchronous output enable control
- Economical 100-pin TQFP package
- Byte write enables
- Clock enable for operation hold
- Multiple chip enables for easy expansion
- 3.3V core power supply
- 2.5V or 3.3V I/O operation with separate V_{DDQ}
- Automatic power down: 30 mW typical standby power
- NTD™ pipeline architecture available (AS7C3256NTD16A/AS7C3256NTD18A)

Note: pins 24, 74 are NC for ×16.

	AS7C3256PFD16-3.5	AS7C3256PFD16-3.8	AS7C3256PFD16-4	AS7C3256PFD16-5	Units
Minimum cycle time	6	6.7	7.5	10	ns
Maximum pipelined clock frequency	166.7	150	133.3	100	MHz
Maximum pipelined clock access time	3.5	3.8	4	5	ns
Maximum operating current	450	400	350	300	mA
Maximum standby current	60	60	60	60	mA
Maximum CMOS standby current (DC)	5	5	5	5	mA

NTD™ is a trademark of Alliance Semiconductor Corporation
Pentium® is a registered trademark of Intel Corporation.

The AS7C3256PFD16A and AS7C3256PFD18A are high performance CMOS 4 Mbit synchronous Static Random Access Memory (SRAM) devices organized as 262,144 words × 16 or 18 bits and incorporate a pipeline for highest frequency on any given technology.

Timing for this device is compatible with existing Pentium synchronous cache specifications. This architecture is suited for ASIC, DSP (TMS320C6X), and PowerPC-based systems in computing, datacomm, instrumentation, and telecommunications systems.

Fast cycle times of 6/6.7/7.5/10 ns with clock access times (t_{CD}) of 3.5/3.5/3.8/5.0 ns enable 167, 150, 133 and 100 MHz bus frequencies. Three chip enable inputs permit easy memory expansion. Burst operation is initiated in one of two ways: the controller address strobe (\overline{ADSC}), or the processor address strobe (\overline{ADSP}). The burst advance pin (\overline{ADV}) allows subsequent internally generated burst addresses.

Read cycles are initiated with \overline{ADSP} (regardless of \overline{WE} and \overline{ADSC}) using the new external address clocked into the on-chip address register when \overline{ADSP} is sampled Low, the chip enables are sampled active, and the output buffer is enabled with \overline{OE} . In a read operation the data accessed by the current address, registered in the address registers by the positive edge of CLK, are carried to the data-out registers and driven on the output pins on the next positive edge of CLK. \overline{ADV} is ignored on the clock edge that samples \overline{ADSP} asserted, but is sampled on all subsequent clock edges. Address is incremented internally for the next access of the burst when \overline{WE} is sampled High, \overline{ADV} is sampled Low, and both address strobes are High. Burst operation is selectable with the MODE input. With MODE unconnected or driven High, burst operations use a Pentium count sequence. With MODE driven LOW the device uses a linear count sequence, suitable for PowerPC and many other applications.

Write cycles are performed by disabling the output buffers with \overline{OE} and asserting a write command. A global write enable \overline{GWE} writes all 32 bits regardless of the state of individual $\overline{BWL[ad]}$ inputs. Alternately, when \overline{GWE} is High, one or more bytes may be written by asserting \overline{BWE} and the appropriate individual byte \overline{BW} signal(s).

\overline{BWN} is ignored on the clock edge that samples \overline{ADSP} Low, but is sampled on all subsequent clock edges. Output buffers are disabled when \overline{BWN} is sampled LOW (regardless of \overline{OE}). Data is clocked into the data input register when \overline{BWN} is sampled Low. Address is incremented internally to the next burst of address if \overline{BWN} and \overline{ADV} are sampled Low.

Read or write cycles may also be initiated with \overline{ADSC} instead of \overline{ADSP} . The differences between cycles initiated with \overline{ADSC} and \overline{ADSP} follow.

- \overline{ADSP} must be sampled HIGH when \overline{ADSC} is sampled LOW to initiate a cycle with \overline{ADSC} .
- \overline{WE} signals are sampled on the clock edge that samples \overline{ADSC} LOW (and \overline{ADSP} High).
- Master chip select $\overline{CS0}$ blocks \overline{ADSP} , but not \overline{ADSC} .

The AS7C3256K16PD and AS7C3256K18PD operate from a 3.3V supply. I/Os use a separate powerPD supply that can operate at 2.5V or 3.3V. These devices are available in a 100-pin 14×20 mm TQFP packaging.

1

Parameter	Symbol	Signals	Test conditions	Max	Unit
Input capacitance	C_{IN}	Address and control pins	$V_{in} = 0V$	4	pF
I/O capacitance	$C_{I/O}$	I/O pins	$V_{in} = V_{out} = 0V$	5	pF

(per byte)

\overline{GWE}	\overline{BWE}	\overline{BWN}	Function
L	X	X	Write all Bytes
H	L	L	Write Byte(s)n
H	H	X	Read
H	L	H	Read

Key: X = Don't Care, L = Low, H = High

Signal	I/O	Properties	Description
CLK	I	CLOCK	Clock. All inputs except OE are synchronous to this clock.
A0–A17	I	SYNC	Address. Sampled when all chip enables are active and ADSC or ADSP are asserted.
DQ[a,b,c,d]	I/O	SYNC	Data. Driven as output when the chip is enabled and OE is active.
CE0	I	SYNC	Master chip enable. Sampled on clock edges when ADSP or ADSC is active. When CE0 is inactive, ADSP is blocked. Refer to the SYNCHRONOUS TRUTH TABLE for more information.
CE1 , CE2	I	SYNC	Synchronous chip enables. Active HIGH and active Low, respectively. Sampled on clock edges when ADSC is active or when CE1 and ADSP are active.
ADSP	I	SYNC	Address strobe (processor). Asserted LOW to load a new address or to enter standby mode.
ADSC	I	SYNC	Address strobe (controller). Asserted LOW to load a new address or to enter standby mode.
ADV	I	SYNC	Burst advance. Asserted LOW to continue burst read/write.
GWE	I	SYNC	Global write enable. Asserted LOW to write all 36 bits. When High, BWE and BW[ab] control write enable.
BWE	I	SYNC	Byte write enable. Asserted LOW with GWE = HIGH to enable effect of BW[ab] inputs.
BW[ab]	I	SYNC	Write enables. Used to control write of individual bytes when GWE = HIGH and BWE = Low. If any of BW[ab] is active with GWE = HIGH and BWE = LOW the cycle is a write cycle. If all BW[ab] are inactive, the cycle is a read cycle.
OE	I	ASYNC	Asynchronous output enable. I/O pins are driven when OE is active and the chip is synchronously enabled.
LBO	I	STATIC default = HIGH	Count mode. When driven High, count sequence follows Intel XOR convention. When driven Low, count sequence follows linear convention. <i>This signal is internally pulled High.</i>
FT	I	STATIC default = HIGH	Flow-through mode. When low, enables single register flow-through mode. Connect to V_{DD} if unused or for pipelined operation. <i>This signal is internally pulled High.</i>
ZZ	I	ASYNC	Sleep. Places device in low power mode; data is retained. Connect to GND if unused.

Parameter	Symbol	Min	Max	Unit
Power supply voltage relative to GND	V_{DD} , V_{DDQ}	-0.5	+4.6	V
Input voltage relative to GND (input pins)	V_{IN}	-0.5	$V_{DD} + 0.5$	V
Input voltage relative to GND (I/O pins)	V_{IN}	-0.5	$V_{DDQ} + 0.5$	V
Power dissipation	P_D	–	1.4	W
DC output current	I_{OUT}	–	50	mA
Storage temperature (plastic)	T_{stg}	-65	+150	°C
Temperature under bias	T_{bias}	-65	+150	°C

NOTE: Stresses greater than those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect reliability.

Rising input

Falling input

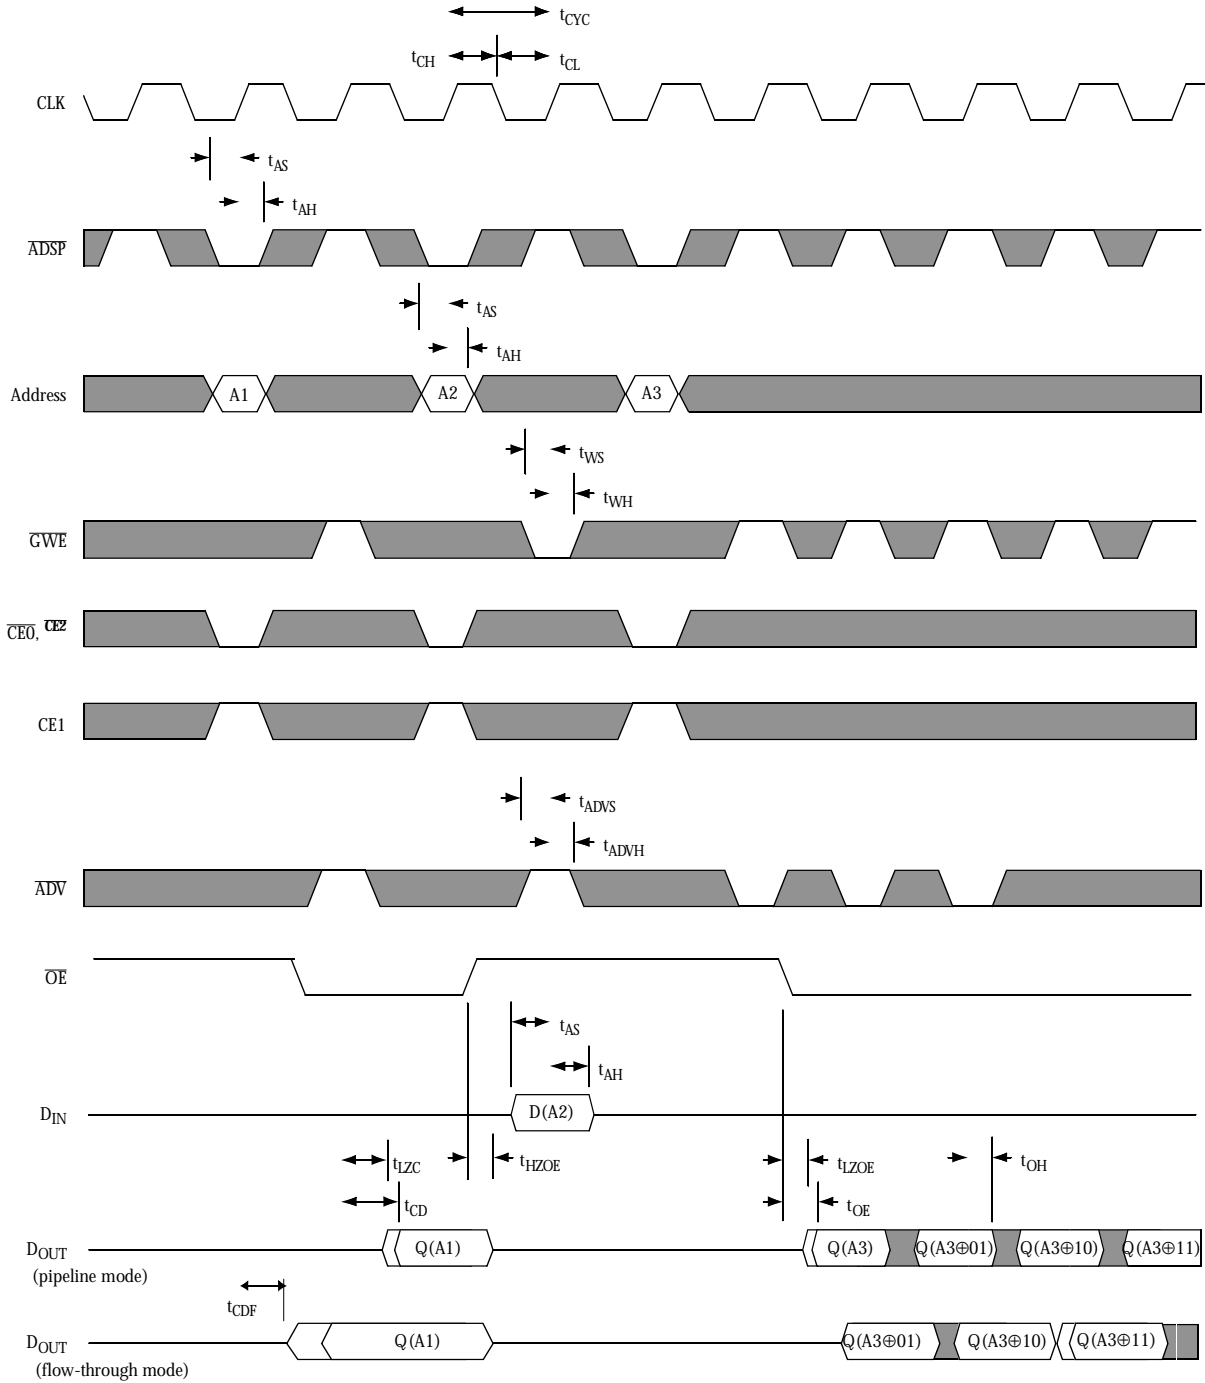

Undefined/don't care

Note: ⊕ = XOR when MODE = High/No Connect; ⊕ = ADD when MODE = Low
[0:3] is don't care.

Note: ⊕ = XOR when MODE = High/No Connect; ⊕ = ADD when MODE = Low.

Note: ⊕ = XOR when MODE = High/No Connect; ⊕ = ADD when MODE = Low.

- 1 This parameter is guaranteed but not tested.
- 2 For test conditions, see AC Test Conditions, Figures A, B, C.
- 3 This parameter is sampled and not 100% tested.
- 4 This is a synchronous device. All addresses must meet the specified setup and hold times for all rising edges of CLK. All other synchronous inputs must meet the setup and hold times with stable logic levels for all rising edges of CLK when chip is enabled.
- 5 Typical values measured at 3.3V, 25°C and 10 ns cycle time.
- 6 I_{CC} given with no output loading. I_{CC} increases with faster cycle times and greater output loading.
- 7 Transitions are measured ± 500 mV from steady state voltage. Output loading specified with $C_L = 5$ pF as in Figure C.
- 8 t_{HZOE} is less than t_{LZOE} ; and t_{HZC} is less than t_{LZC} at any given temperature and voltage.
- 9 t_{HZCN} is a 'no load' parameter to indicate exactly when SRAM outputs have stopped driving.

- Output Load: see Figure B, except for t_{LZC} , t_{LZOE} , t_{HZOE} , t_{HZC} see Figure C.
- Input pulse level: GND to 3V. See Figure A.
- Input rise and fall time (Measured at 0.3V and 2.7V): 2 ns. See Figure A.
- Input and output timing reference levels: 1.5V.
