Caution: These CMOS devices have input static protection (Class 3) but are still susceptible to damage if exposed to extremely high static electrical charges.

The A6A259KA and A6A259KLB combine a 3-to-8 line CMOS decoder and accompanying data latches, control circuitry, and DMOS outputs in a multi-functional power driver capable of storing single-line data in the addressable latches or use as a decoder or demultiplexer. Driver applications include relays, solenoids, and other medium-current or high-voltage peripheral power loads.

The CMOS inputs and latches allow direct interfacing with micro-processor-based systems. Use with TTL may require appropriate pull-up resistors to ensure an input logic high. Four modes of operation are selectable with the CLEAR and ENABLE inputs.

The addressed DMOS output inverts the DATA input with all unaddressed outputs remaining in their previous states. All of the output drivers are disabled (the DMOS sink drivers turned off) with the CLEAR input low and the ENABLE input high. The A6A259KA/KLB DMOS open-drain outputs are capable of sinking up to 500 mA.

The A6A259KA is furnished in a 20-pin dual in-line plastic package. The A6A259KLB is furnished in a 24-lead wide-body, small-outline plastic batwing package (SOIC) with gull-wing leads for surface-mount applications. Copper lead frames, reduced supply current requirements, and low on-state resistance allow both devices to sink 150 mA from all outputs continuously, to ambient temperatures over 85°C.

FUNCTIONAL DESCRIPTION and INPUT REQUIREMENTS

Dwg. WP-036

OUTPUT SWITCHING TIME

Four modes of operation are selectable by controlling the CLEAR and ENABLE inputs as shown above.

In the addressable-latch mode, data at the DATA input is written into the addressed transparent latch. The addressed output inverts the data input with all other outputs remaining in their previous states.

In the memory mode, all outputs remain in their previous states and are unaffected by the DATA or address (S_n) inputs. To prevent entering erroneous data in the latches, ENABLE should be held HIGH while the address lines are changing.

In the demultiplexing/decoding mode, the addressed output inverts the data input and all other outputs are OFF.

In the clear mode, all outputs are OFF and are unaffected by the DATA or address (S_n) inputs.

Given the appropriate inputs, when DATA is LOW for a given address, the output is OFF; when DATA is HIGH, the output is ON and can sink current.
