**1048576 BY 1-BIT**  
**DYNAMIC RANDOM-ACCESS MEMORY**  
SGMS023E – DECEMBER 1988 – REVISED MARCH 1996

- Organization . . . 1048576 × 1-Bit
- Processed to MIL-STD-883, Class B
- Single 5-V Supply (10% Tolerance)
- Performance Ranges:

	ACCESS TIME $t_a(R)$ (MAX)	ACCESS TIME $t_a(C)$ (MAX)	ACCESS TIME $t_a(CA)$ (MAX)	READ OR WRITE CYCLE (MIN)
'4C1024-80	80 ns	20 ns	40 ns	150 ns
'4C1024-10	100 ns	25 ns	45 ns	190 ns
'4C1024-12	120 ns	30 ns	55 ns	220 ns
'4C1024-15	150 ns	40 ns	70 ns	260 ns

- Enhanced Page-Mode Operation for Faster Memory Access

- Higher Data Bandwidth Than Conventional Page Mode Parts
- Random Single-Bit Access Within a Row With a Column Address

- One of TI's CMOS Megabit Dynamic Random-Access Memory (DRAM) Family Including SMJ44C256 — 256K × 4 Enhanced Page Mode

- CAS-Before-RAS (CBR) Refresh

- Long Refresh Period  
512-Cycle Refresh in 8 ms (Max)

- 3-State Unlatched Output

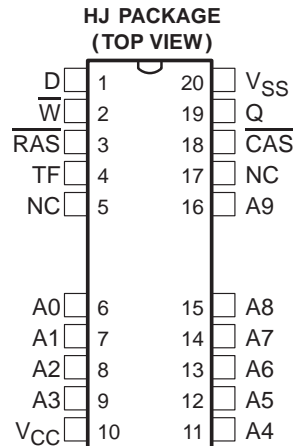

- Low Power Dissipation

- All Inputs/Outputs and Clocks Are TTL-Compatible

- Packaging Offered:

- 20/26-Pin J-Leaded Ceramic Surface Mount Package (HJ Suffix)
- 18-Pin 300-Mil Ceramic Dual-In-Line Package (JD Suffix)
- 20-Pin Ceramic Flatpack (HK Suffix)
- 20/26-Terminal Leadless Ceramic Surface Mount Package (FQ/HL Suffixes)
- 20-Pin Ceramic Zig-Zag In-Line Package (SV Suffix)

- Operating Temperature Range  
– 55°C to 125°C

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

NC	No Internal Connection
$\overline{\text{Q}}$	Data Out
$\overline{\text{RAS}}$	Row Address Strobe
TF	Test Function
V <sub>CC</sub>	5-V Supply
V <sub>SS</sub>	Ground
W	Write Enable

**description**

The SMJ4C1024 is a 1048576-bit DRAM organized as 1048576 words of one bit each. It employs technology for high performance, reliability, and low power at a low cost.

This device features maximum  $\overline{\text{RAS}}$  access times of 80 ns, 100 ns, 120 ns, and 150 ns. Maximum power dissipation is as low as 305 mW operating and 16.5 mW standby on 150-ns devices.

I<sub>DD</sub> peaks are typically 140 mA and a –1 V input voltage undershoot can be tolerated, minimizing system noise.

All inputs and outputs, including clocks, are compatible with series 54 TTL. All addresses and data-in lines are latched on-chip to simplify system design. Data out is unlatched to allow greater system flexibility.

The SMJ4C1024 is offered in an 18-pin ceramic dual-in-line package (JD suffix), a 20/26-terminal leadless ceramic carrier package (FQ/HL suffixes), a 20/26-pin J-leaded carrier package (HJ suffix), a 20-pin flatpack (HK suffix), and a 20-pin ceramic zig-zag in-line package (SV suffix). They are characterized for operation from –55°C to 125°C.

**DYNAMIC RANDOM-ACCESS MEMORY**

SGMS023E – DECEMBER 1988 – REVISED MARCH 1996

**functional block diagram**

**operation**

**enhanced page mode**

Enhanced page-mode operation allows faster memory access by keeping the same row address while selecting random column addresses. The time for row-address setup and hold and for address multiplexing is eliminated. The maximum number of columns that can be accessed is determined by the maximum  $\overline{RAS}$  low time and the  $\overline{CAS}$  page-cycle time used. With minimum  $\overline{CAS}$  page-cycle time, all 1024 columns specified by column addresses A0 through A9 can be accessed without intervening  $\overline{RAS}$  cycles.

Unlike conventional page-mode DRAMs, the column-address buffers in this device are activated on the falling edge of  $\overline{RAS}$ . The buffers act as transparent or flow-through latches while  $\overline{CAS}$  is high. The falling edge of  $\overline{CAS}$  latches the column addresses. This feature lets the SMJ4C1024 operate at a higher data bandwidth than conventional page-mode parts, since data retrieval begins as soon as the column address is valid rather than when  $\overline{CAS}$  goes low. This performance improvement is referred to as enhanced page mode. A valid column address can be presented immediately after the row-address hold time has been satisfied, usually well in advance of the falling edge of  $\overline{CAS}$ . In this case, data is obtained after  $t_{a(C)}$  maximum (access time from  $\overline{CAS}$  low) if  $t_{a(CA)}$  maximum (access time from column address) has been satisfied. If the column addresses for the next page cycle are valid at the same time  $\overline{CAS}$  goes high, access time for the next cycle is determined by the later occurrence of  $t_{a(CA)}$  or  $t_{a(CP)}$  (access time from rising edge of  $\overline{CAS}$ ).

**address (A0–A9)**

Twenty address bits are required to decode one of 1048576 storage cell locations. Ten row-address bits are set up on inputs A0 through A9 and latched onto the chip by  $\overline{RAS}$ . The ten column-address bits are set up on pins A0 through A9 and latched onto the chip by  $\overline{CAS}$ . All addresses must be stable on or before the falling edges

### address (A0–A9) (continued)

of  $\overline{\text{RAS}}$  and  $\overline{\text{CAS}}$ .  $\overline{\text{RAS}}$  is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder.  $\overline{\text{CAS}}$  is used as a chip select to activate the output buffer as well as to latch the address bits into the column-address buffer.

### write enable ( $\overline{\text{W}}$ )

The read or write mode is selected through  $\overline{\text{W}}$ . A logic high on the  $\overline{\text{W}}$  input selects the read mode and a logic low selects the write mode. The write-enable pin can be driven from standard TTL circuits without a pullup resistor. The data input is disabled when the read mode is selected. When  $\overline{\text{W}}$  goes low prior to  $\overline{\text{CAS}}$  (early write), data out remains in the high-impedance state for the entire cycle, permitting common input/output operation.

### data in (D)

Data-in is written during a write or a read-modify-write cycle. Depending on the mode of operation, the falling edge of  $\overline{\text{CAS}}$  or  $\overline{\text{W}}$  strobes data into the on-chip latch. In an early-write cycle,  $\overline{\text{W}}$  is brought low prior to  $\overline{\text{CAS}}$ , and the data is strobed in by  $\overline{\text{CAS}}$  with setup and hold times referenced to this signal. In a delayed-write or a read-modify-write cycle,  $\overline{\text{CAS}}$  is already low, and the data is strobed in by  $\overline{\text{W}}$  with setup and hold times referenced to this signal.

### data out (Q)

The 3-state output buffers provide direct TTL compatibility (no pullup resistor required) with a fanout of two series 54 TTL loads. Data out is the same polarity as data in. The output is in the high-impedance (floating) state until  $\overline{\text{CAS}}$  is brought low. In a read cycle, the output becomes valid after the access time  $t_{a(C)}$ . The access time from  $\overline{\text{CAS}}$  low ( $t_{a(C)}$ ) begins with the negative transition of  $\overline{\text{CAS}}$  as long as  $t_{a(R)}$  and  $t_{a(CA)}$  are satisfied. The output becomes valid after the access time has elapsed and remains valid while  $\overline{\text{CAS}}$  is low; when  $\overline{\text{CAS}}$  goes high, the output returns to a high-impedance state. In a delayed-write or read-modify-write cycle, the output follows the sequence for the read cycle.

### refresh

A refresh operation must be performed at least once every 8 ms to retain data. This can be achieved by strobing each of the 512 rows (A0–A8). A normal read or write cycle refreshes all bits in each selected row. A RAS-only operation can be used by holding  $\overline{\text{CAS}}$  at the high (inactive) level, conserving power as the output buffer remains in the high-impedance state. Externally generated addresses must be used for a RAS-only refresh. Hidden refresh can be performed while maintaining valid data at the output pin. This is accomplished by holding  $\overline{\text{CAS}}$  at  $V_{IL}$  after a read operation and cycling  $\overline{\text{RAS}}$  after a specified precharge period, similar to a RAS-only refresh cycle.

### $\overline{\text{CAS}}$ -before- $\overline{\text{RAS}}$ (CBR) refresh

CBR refresh is used by bringing  $\overline{\text{CAS}}$  low earlier than  $\overline{\text{RAS}}$  (see parameter  $t_{d(CLRL)R}$ ) and holding it low after  $\overline{\text{RAS}}$  falls (parameter  $t_{d(RLCH)R}$ ). For successive CBR refresh cycles,  $\overline{\text{CAS}}$  can remain low while cycling  $\overline{\text{RAS}}$ . The external address is ignored and the refresh address is generated internally. The external address is also ignored during the hidden refresh cycles.

### power up

To achieve proper device operation, an initial pause of 200  $\mu\text{s}$  followed by a minimum of eight initialization cycles is required after full  $V_{CC}$  level is achieved.

### test function (TF) pin

During normal device operation, TF must be disconnected or biased at a voltage  $\leq V_{CC}$ .

**SMJ4C1024**  
**1048576 BY 1-BIT**  
**DYNAMIC RANDOM-ACCESS MEMORY**  
 SGMS023E – DECEMBER 1988 – REVISED MARCH 1996

**absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†**

Voltage range on any pin (see Note 1)	– 1 V to 7 V
Voltage range on $V_{CC}$	– 1 V to 7 V
Short-circuit output current, $I_{OS}$	50 mA
Power dissipation	1 W
Operating free-air temperature range, $T_A$	– 55°C to 125°C
Storage temperature range, $T_{stg}$	– 65°C to 150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 1: All voltage values are with respect to  $V_{SS}$ .

**recommended operating conditions**

	MIN	NOM	MAX	UNIT
$V_{CC}$ Supply voltage	4.5	5	5.5	V
$V_{IH}$ High-level input voltage	2.4		6.5	V
$V_{IL}$ Low-level input voltage (see Note 2)	– 1		0.8	V
$T_A$ Minimum operating free-air temperature	– 55			°C
$T_C$ Maximum operating case temperature			125	°C

NOTE 2: The algebraic convention, where the more negative (less positive) limit is designated as minimum, is used for logic-voltage levels only.

PARAMETER MEASUREMENT INFORMATION

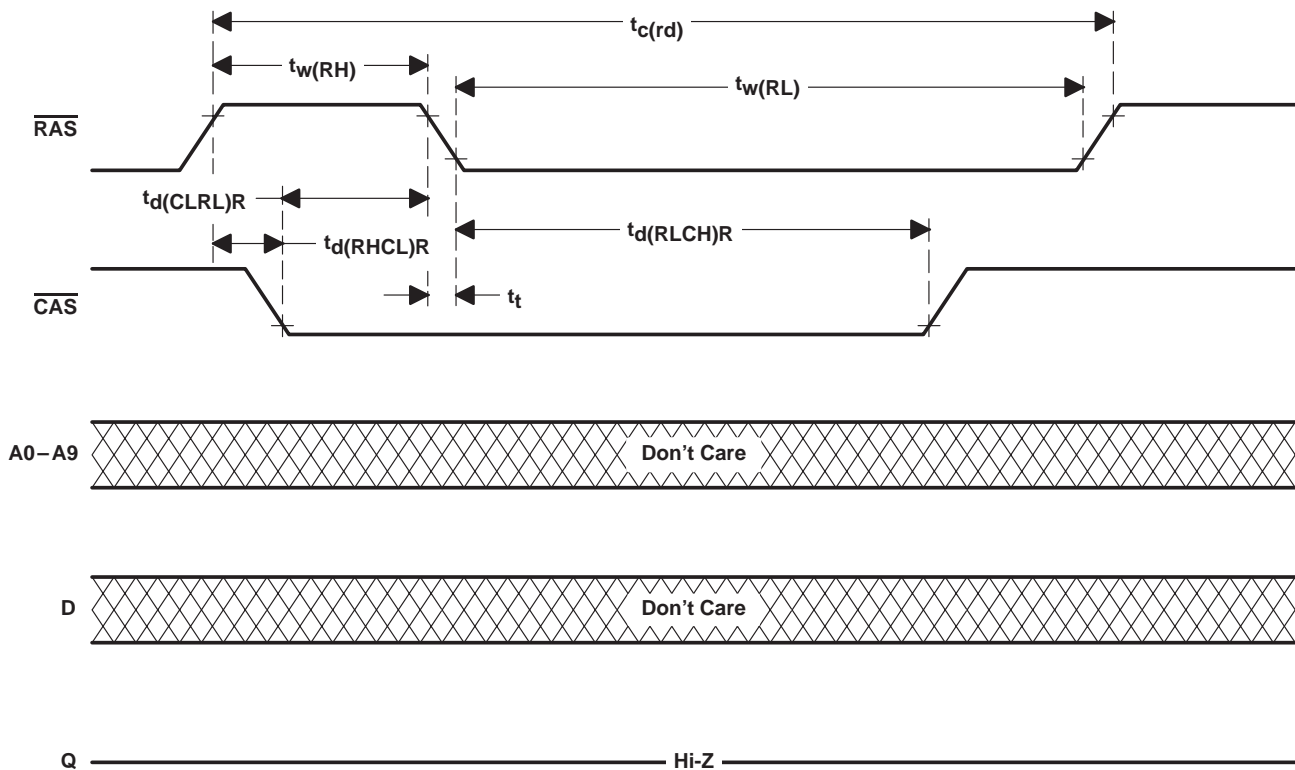

Figure 11. Automatic-CBR-Refresh-Cycle Timing

MECHANICAL DATA

HJ (R-CDCC-J20)

J-LEADED CERAMIC CHIP CARRIER

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. This package can be hermetically sealed with a metal lid.  
 D. The terminals will be gold plated.

 DYNAMIC RANDOM-ACCESS MEMORY  
 SGMS023E – DECEMBER 1988 – REVISED MARCH 1996

MECHANICAL DATA

HK (R-CDFP-F20)

CERAMIC DUAL FLATPACK

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. This package can be hermetically sealed with a metal lid.  
 D. The terminals are gold plated.

MECHANICAL DATA

FQ (R-CDCC-N20)

LEADLESS CERAMIC CHIP CARRIER

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. This package can be hermetically sealed with a metal lid.  
 D. The terminals are gold plated.

SGMS023E – DECEMBER 1988 – REVISED MARCH 1996

MECHANICAL DATA

HL (R-CDCC-N20/26)

LEADLESS CERAMIC CHIP CARRIER

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. This package can be hermetically sealed with a metal lid.  
 D. The terminals are gold plated.

20 PIN SHOWN

- NOTES: A. All linear dimensions are in inches (millimeters).  
 B. This drawing is subject to change without notice.  
 C. This package can be hermetically sealed with a metal lid.  
 D. The terminals are gold plated.

## **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

**CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.**

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
