### DESCRIPTION

The AZ10/100E131 is a quad master-slave D-type flip-flop with differential outputs. Each flip-flop may be clocked separately by holding Common Clock ( $C_C$ ) LOW and using the Clock Enable ( $\overline{CE_n}$ ) inputs for clocking. Common clocking is achieved by holding the  $\overline{CE_n}$  inputs LOW and using  $C_C$  to clock all four flip-flops. In this case, the  $\overline{CE_n}$  inputs perform the function of controlling the common clock to each flip-flop.

Individual asynchronous resets are provided ( $R_n$ ). Asynchronous set controls ( $S_n$ ) are ganged together in pairs, with the pairing chosen to reflect physical chip symmetry.

Data enters the master when both  $C_C$  and  $\overline{CE_n}$  are LOW, and transfers to the slave when either  $C_C$  or  $\overline{CE_n}$  (or both) go HIGH.

NOTE: Specifications in ECL/PECL tables are valid when thermal equilibrium is established.

\* All  $V_{CC}$  and  $V_{CCO}$  pins are tied together on the die.
