

DAC56

Monolithic 16-Bit Resolution DIGITAL-TO-ANALOG CONVERTER

FEATURES

- **COMPLETE D/A CONVERTER:**
Internal Voltage Reference
 $\pm 3V$ Output Operational Amplifier
Pinout Allows I_{OUT} ($\pm 1.0mA$) Option
No external components required
- **0.012% LINEARITY ERROR MAX**
- **12-BIT MONOTONICITY GUARANTEED
OVER $0^{\circ}C$ TO $+70^{\circ}C$**
- **$\pm 5V$ TO $\pm 12V$ POWER SUPPLY**
- **SETTLING TIME:** $V_{OUT} = 1.5\mu s$;
 $I_{OUT} = 350ns$
- **SERIAL DATA INPUT: Binary Two's
Complement**
- **16-PIN PLASTIC DIP AND SOIC**

DESCRIPTION

The DAC56 is a complete 16-bit monolithic D/A converter. Completely self-contained with a stable, low noise, internal zener voltage reference; high-speed current switches; a resistor ladder network; and a low noise output operational amplifier all on a single monolithic chip. The DAC56 operates over a wide power supply range from $\pm 5V$ to $\pm 12V$.

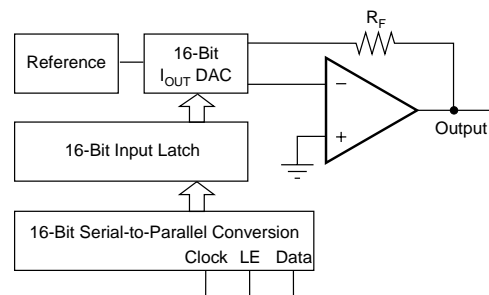

Differential linearity error (DLE) is guaranteed to meet specifications without external adjustment. However, provisions for an externally adjustable circuit controlling the MSB error, the differential linearity error at bipolar zero, makes the DLE at BPZ essentially zero and provides for high system performance. The I/V amplifier stage includes an output current limiting circuit to protect both amplifier and load from excessive current. This assures the user of high system reliability.

APPLICATIONS

- **PROCESS CONTROL**
- **ATE PIN ELECTRONICS LEVEL SETTING**
- **CLOSED-LOOP SERVO-CONTROL**
- **AUTO-CALIBRATION CIRCUIT FOR A/D
BOARDS**
- **UP-GRADE REPLACEMENT FOR
MULTIPLYING D/A**
- **X-Y PLOTTER**
- **DSP PROCESSOR BOARDS**

A high-speed interface is capable of clocking in data at a rate of 10MHz max, and its interface logic contains a serial data clock (input), serial data (input) and latch-enable (input). Serial data is clocked MSB first into a 16-bit register and then latched into a 16-bit parallel register.

The DAC56 is packaged in a 16-pin plastic DIP and 16-pin SOIC.

SPECIFICATIONS

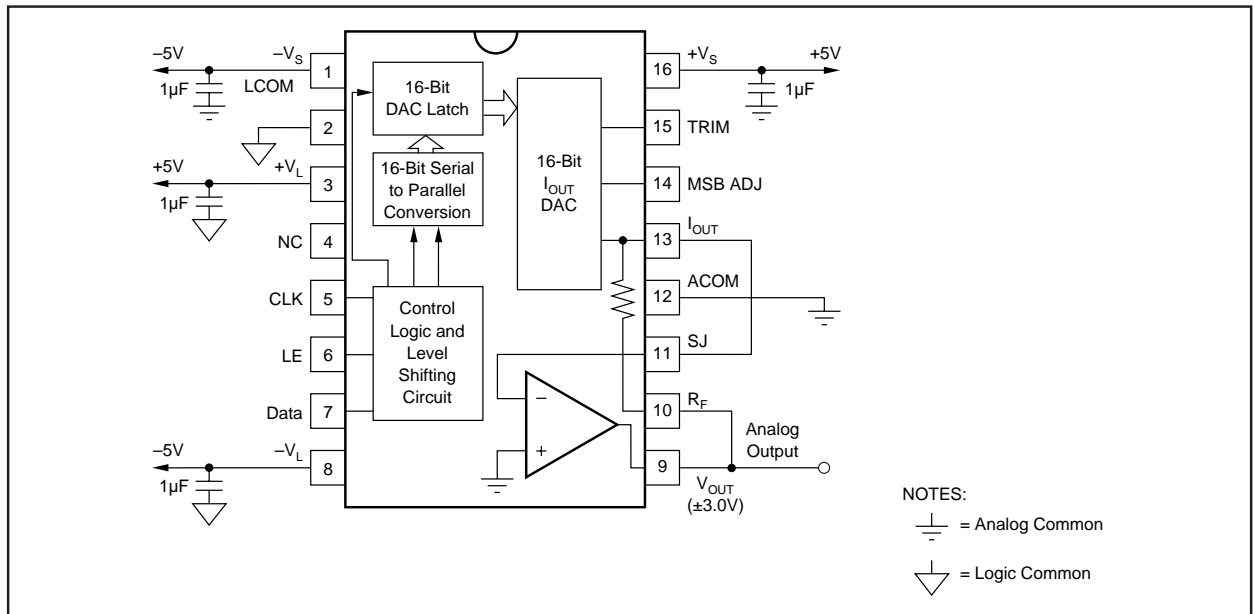

ELECTRICAL

All specifications at +25°C, and power supply voltage of ±5V, unless otherwise noted.

PARAMETER	CONDITIONS	DAC56			UNITS
		MIN	TYP	MAX	
DIGITAL INPUT Resolution Digital Input Level: ⁽¹⁾ V_{IH} V_{IL} $I_{IH} \cdot V_I = +2.7V$ $I_{IL} \cdot V_I = +0.4V$ Input Clock Frequency		+2.4 0	16	+ V_L +0.8 +1 -50	Bits V V μA μA MHz

TEMPERATURE RANGE Specification Storage		0 -60		70 100	°C °C

NOTES: (1) Logic input levels are TTL-/CMOS-compatible. (2) FSR means full-scale range and is equivalent to 6V (±3V) for DAC56 in the V_{OUT} mode. (3) Measured with an active clamp to provide a low impedance for approximately 200ns. (4) All specifications assume + V_S connected to + V_L and - V_S connected to - V_L . If supplies are connected separately, - V_L must not be more negative than - V_S to assure proper operation. No similar restriction applies to the value of + V_L with respect to + V_S .

PIN CONFIGURATION

PIN ASSIGNMENTS

PIN	NAME	FUNCTION
1	-V _S	Analog Negative Supply
2	LCOM	Logic Common
3	+V _L	Logic Positive Supply
4	NC	No Connection
5	CLK	Clock Input
6	LE	Latch Enable Input
7	DATA	Serial Data Input
8	-V _L	Logic Negative Supply
9	V _{OUT}	Voltage Output
10	R _F	Feedback Resistor
11	SJ	Summing Junction
12	ACOM	Analog Common
13	I _{OUT}	Current Output
14	MSB ADJ	MSB Adjustment Terminal
15	TRIM	MSB Trim-pot Terminal
16	+V _S	Analog Positive Supply

ABSOLUTE MAXIMUM RATINGS

DC Supply Voltage	±15VDC
Input Logic Voltage	-1V to +V _S +V _L
Power Dissipation	850mW
Operating Temperature	-25°C to +70°C
Storage Temperature	-80°C to +100°C
Lead Temperature (soldering, 10s)	+300°C

ELECTROSTATIC DISCHARGE SENSITIVITY

Electrostatic discharge can cause damage ranging from performance degradation to complete device failure. Burr-Brown Corporation recommends that all integrated circuits be handled and stored using appropriate ESD protection methods.

PACKAGE INFORMATION

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER ⁽¹⁾
DAC56P	16-Pin Plastic DIP	180
DAC56U	16-Pin SOIC	211

OPERATING INSTRUCTIONS

The accuracy of a D/A converter is described by the transfer function as shown in Figure 1. Digital input to analog output converter relationships are shown in Table I. The errors in the D/A converter are combinations of analog errors due to the linear circuitry, matching and tracking properties of the ladder and scaling networks, power supply rejection, and reference errors. In summary, these errors consist of initial errors including gain, offset, linearity, differential linearity, and power supply sensitivity. Gain drift over temperature rotates the line (Figure 1) about the bipolar zero point and offset drift shifts the line left or right over the operating temperature range. Most of the offset and gain drift is due to the drift of the internal reference zener diode with temperature or time.

The converter is designed so that these drifts are in opposite directions. This way the bipolar zero voltage is virtually unaffected by variations in the reference voltage.

FIGURE 1. Input vs Output for an Ideal Bipolar D/A Converter.

DIGITAL INPUT	ANALOG OUTPUT		
	DAC Output	Voltage (V), V _{OUT} Mode	Current (mA), I _{OUT} Mode
Binary Two's Complement (BTC)			
7FFF _H	+ Full Scale	+2.999908	-0.999970
8000 _H	- Full Scale	-3.000000	+1.000000
0000 _H	Bipolar Zero	0.000000	0.000000
FFFF _H	Zero -1LSB	-0.000092	+0.030500μA

TABLE I. Digital Input to Analog Output Relationship.

DIGITAL INPUT CODES

The DAC56 accepts serial input data (MSB first) in Binary Two's Complement form—Refer to Table I for input/output relationships.

POWER SUPPLY CONNECTIONS

Power supply decoupling capacitors should be added as shown in the Connection Diagram (Figure 2), for optimum performance and noise rejection.

These capacitors (1μF tantalum recommended) should be connected as close as possible to the converter.

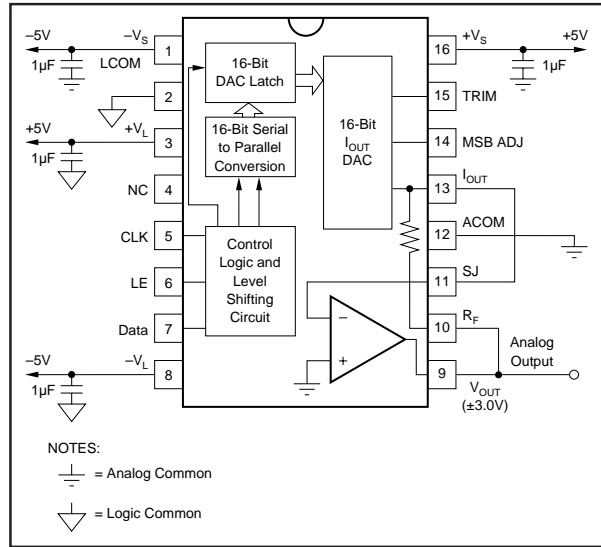

FIGURE 2. Connection Diagram.

MSB ERROR ADJUSTMENT (OPTIONAL)

Differential linearity error at all codes of the DAC56 is guaranteed to meet specifications without an external adjustment. However, if adjustment of the differential linearity error at bipolar zero is desired, it can be trimmed essentially to zero using the circuit as shown in Figure 3.

FIGURE 3. MSB Adjustment Circuit.

After allowing ample warm-up time (5 to 10 minutes) to assure stable operation, select the input code FFFF_H. Measure the output voltage using a 6-1/2 digit voltmeter and record the measurement. Change the digital input code to 0000_H. Adjust the 100kΩ potentiometer (TCR of 100ppm per °C or less is recommended) to make the output voltage read 1LSB more than the voltage reading of the previous code (ex. 1LSB = 92μV at FSR = 6V).

If the MSB adjustment circuit is not used, pins 14 and 15 should be left open.

FIGURE 4. Input Timing Diagram.

FIGURE 5. Input Timing Relationships.

INPUT TIMING CONSIDERATIONS

Figures 4 and 5 refer to the input timing required to interface the inputs of DAC56 to a serial input data stream. Serial data is accepted in Binary Two's Complement with the MSB being loaded first. Data is clocked in on positive going clock (CLK, pin 5) edges and is latched into the DAC input register on negative going latch enable (LE, pin 6) edges.

The latch enable input must be high for at least one clock cycle before going low, and then must be held low for at least one clock cycle. The last 16 data bits clocked into the serial input register are those that are transferred to the DAC input register when latch enable goes low. In other words, when more than 16 clock cycles occur between a latch enable, only the data present during the last 16 clocks will be transferred to the DAC input register.

Figure 4 gives the general input format required for the DAC56. Figure 5 shows the specific relationships between the various signals and their timing constraints.
