

# Off-Line Current Mode PWM Control Circuit with Undervoltage Lockout

## Description

The CS284XA, CS384XA provides all the necessary features to implement off-line fixed frequency current-mode control with a minimum number of external components.

The CS384XA family incorporates a new precision temperature-controlled oscillator with an internally trimmed discharge current to minimize variations in frequency. A precision duty-cycle clamp eliminates the need for an external oscillator when a 50% duty-cycle is used. Duty-cycles greater than 50% are also possible. On board logic ensures that  $V_{REF}$  is stabilized before

the output stage is enabled. Ion implant resistors provide tighter control of undervoltage lockout.

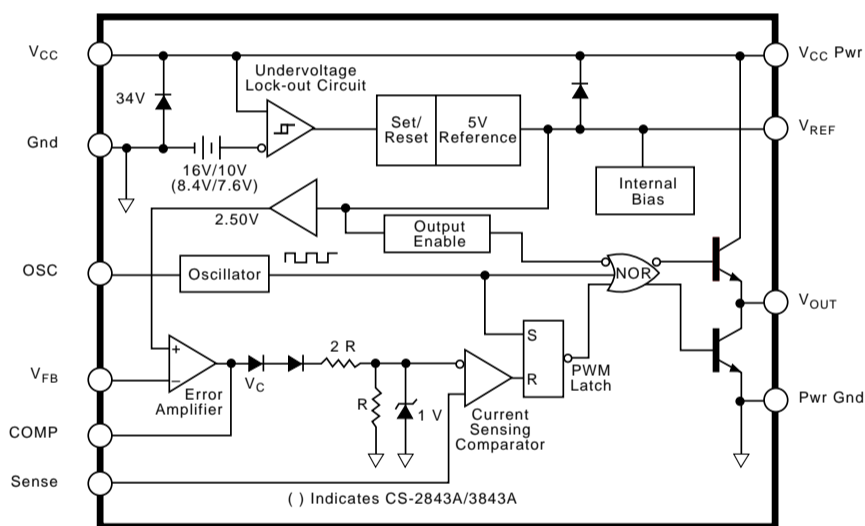

Other features include low start-up current, pulse-by-pulse current limiting, and a high-current totem pole output for driving capacitive loads, such as the gate of power MOSFET. The output is LOW in the off state, consistent with N-channel devices.

The CS384XA series of current-mode control ICs are available in 8 and 14 lead packages for surface mount (SO) applications as well as 8 lead PDIP packages.

## Absolute Maximum Ratings

Supply Voltage ( $I_{CC} < 30mA$ ).....	Self Limiting
Supply Voltage (Low Impedance Source) .....	30V
Output Current.....	$\pm 1A$
Output Energy (Capacitive Load) .....	5 $\mu J$
Analog Inputs ( $V_{FB}$ , Sense).....	-0.3V to 5.5V
Error Amp Output Sink Current .....	10mA
Lead Temperature Soldering	
Wave Solder (through hole styles only) .....	10 sec. max, 260°C peak
Reflow (SMD styles only) .....	60 sec. max above 183°C, 230°C peak

## Block Diagram

## Features

- Optimized for Off-line Control
- Internally Trimmed Temperature Compensated Oscillator
- Maximum Duty-cycle Clamp
- $V_{REF}$  stabilized before Output Stage is Enabled
- Low Start-up Current
- Pulse-by-pulse Current Limiting
- Improved Undervoltage Lockout
- Double Pulse Suppression
- 1% Trimmed Bandgap Reference
- High Current Totem Pole Output

## Package Options

### 8 Lead PDIP & SO Narrow

### 14 Lead SO Narrow

Electrical Characteristics:  $-25^{\circ} \leq T_A \leq 85^{\circ} \text{C}$  for CS2842A/2843A,  $0^{\circ} \leq T_A \leq 70^{\circ} \text{C}$  for CS3842A/3843A.  $V_{CC} = 15\text{V}$  (Note 1);  $R_T = 680\Omega$ ,  $C_T = .022\mu\text{F}$  for triangular mode,  $R_T = 10\text{k}\Omega$ ,  $C_T = 3.3\text{nF}$  for sawtooth mode (see Figure 3), unless otherwise stated.

Test Circuit

Circuit Description

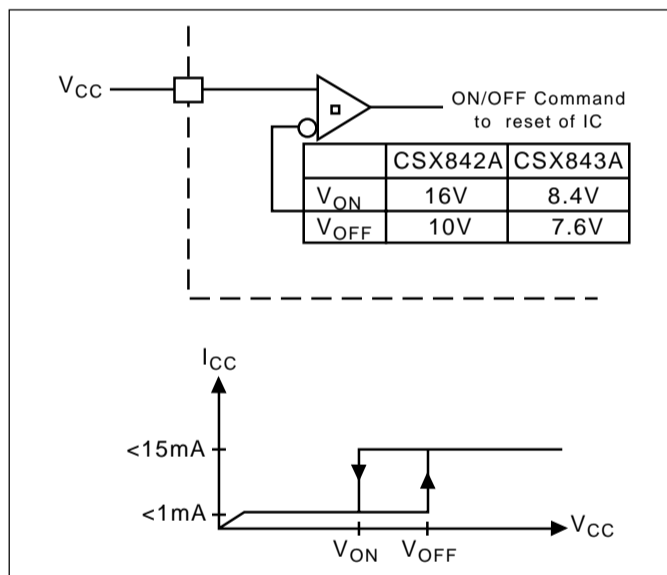

Figure 1: Typical Undervoltage Characteristics

### Undervoltage Lockout

During Undervoltage Lockout (Figure 1), the output driver is biased to a high impedance state. The output should be shunted to ground with a resistor to prevent output leakage current from activating the power switch.

### PWM Waveform

To generate the PWM waveform, the control voltage from the error amplifier is compared to a current sense signal which represents the peak output inductor current (Figure 2). An increase in  $V_{CC}$  causes the inductor current slope to increase, thus reducing the duty cycle. This is an inherent feed-forward characteristic of current mode control, since the control voltage does not have to change during changes of input supply voltage.

When the power supply sees a sudden large output current increase, the control voltage will increase allowing the duty cycle to momentarily increase. Since the duty cycle tends to exceed the maximum allowed to prevent trans-

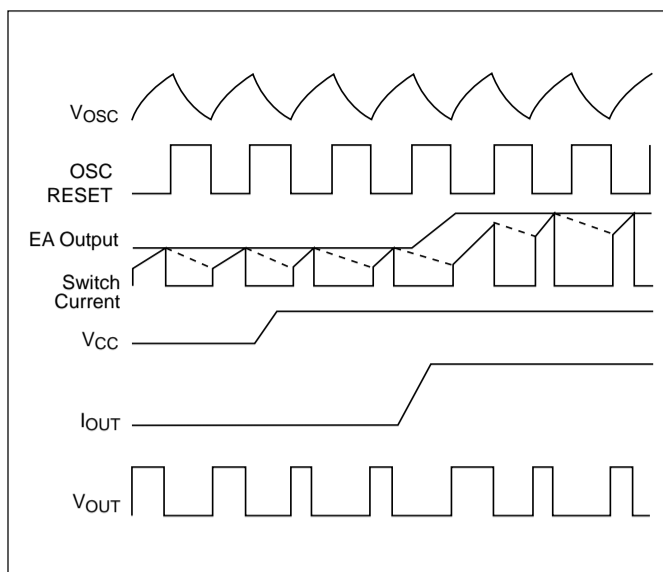

Figure 2: Timing Diagram for key CS2841B parameters

former saturation in some power supplies, the internal oscillator waveform provides the maximum duty cycle clamp as programmed by the selection of oscillator components.

### Setting the Oscillator

Oscillator timing capacitor,  $C_T$ , is charged by  $V_{REF}$  through  $R_T$  and discharged by an internal current source. During the discharge time, the internal clock signal blanks out the output to the Low state, thus providing a user selected maximum duty cycle clamp. Charge and discharge times are determined by the formula:

$$t_c = R_T C_T \ln \left( \frac{V_{REF} - V_{lower}}{V_{REF} - V_{upper}} \right)$$

$$t_d = R_T C_T \ln \left( \frac{V_{REF} - I_d R_T - V_{lower}}{V_{REF} - I_d R_T - V_{upper}} \right)$$

Substituting in typical values for the parameters in the above formulas:

$$V_{REF} = 5.0V, V_{upper} = 2.7V, V_{lower} = 1.0V, I_d = 8.3mA$$

$$t_c \approx 0.5534 R_T C_T$$

$$t_d = R_T C_T \ln \left( \frac{2.3 - 0.0083 R_T}{4.0 - 0.0083 R_T} \right)$$

The frequency and maximum duty cycle can be determined using the Typical Performance Characteristic graphs.

### Grounding

High peak currents associated with capacitive loads necessitate careful grounding techniques. Timing and bypass capacitors should be connected close to Gnd pin in a single point ground.

The transistor and  $5k\Omega$  potentiometer, shown in the test circuit, are used to sample the oscillator waveform and apply an adjustable ramp to Sense.
