

CYPRESS

CY7C168A

4Kx4 RAM

Features

- Automatic power-down when deselected
- CMOS for optimum speed/power
- High speed
 - $t_{AA} = 15$ ns
- Low active power
 - 633 mW
- Low standby power
 - 110 mW
- TTL-compatible inputs and outputs
- V_{IH} of 2.2V
- Capable of withstanding greater than 2001V electrostatic discharge

Functional Description

The CY7C168A is a high-performance CMOS static RAM organized as 4096 by 4 bits. Easy memory expansion is provided by an active LOW Chip Enable (\overline{CE}) and three-state drivers. The CY7C168A has an automatic power-down feature, reducing the power consumption by 77% when deselected.

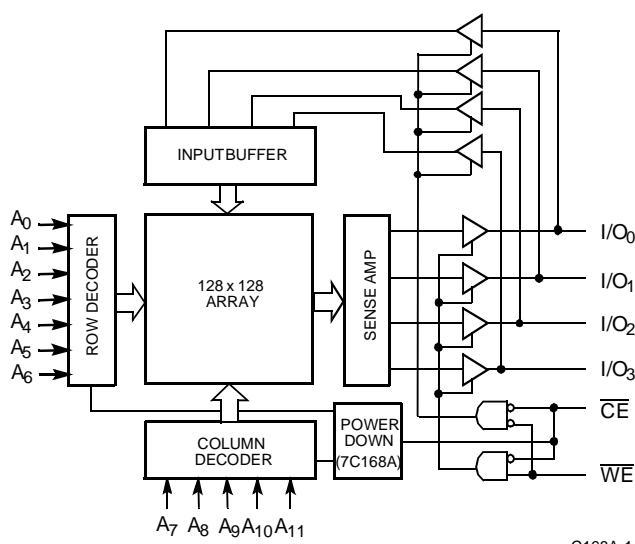

Writing to the device is accomplished when the Chip Select (\overline{CE}) and Write Enable (\overline{WE}) inputs are both LOW. Data on the four data input/output pins (I/O_0 through I/O_3) is written into the memory location specified on the address pins (A_0 through A_{11}).

Reading the device is accomplished by taking the Chip Enable (\overline{CE}) LOW, while Write Enable (\overline{WE}) remains HIGH. Under these conditions, the contents of the location specified on the address pins will appear on the four data input/output pins (I/O_0 through I/O_3).

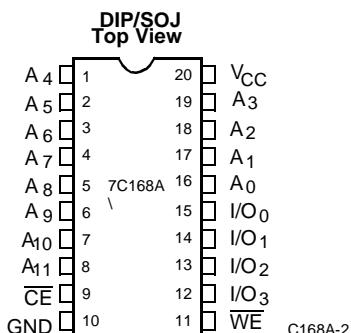

The input/output pins remain in a high-impedance state when Chip Enable (\overline{CE}) is HIGH or Write Enable (\overline{WE}) is LOW.

A die coat is used to insure alpha immunity.

Switching Waveforms
Read Cycle No. 1^[10, 11]

C168A-5

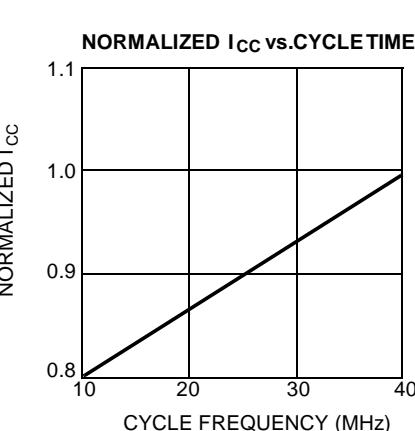

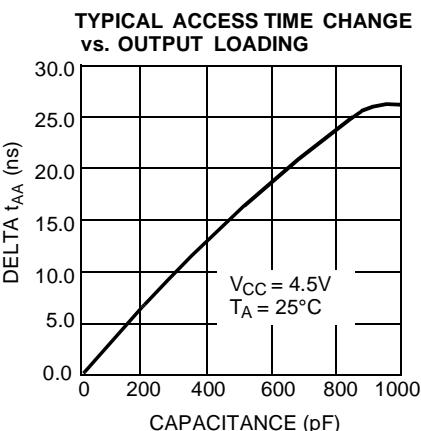

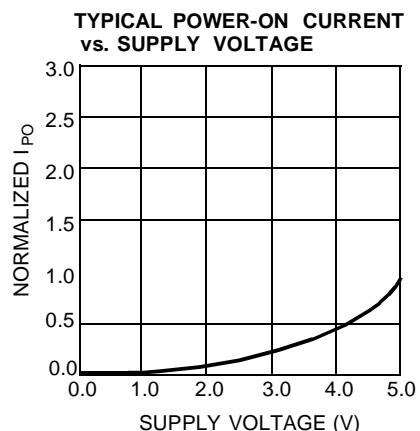

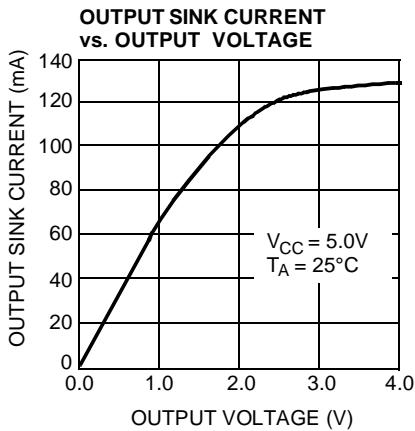

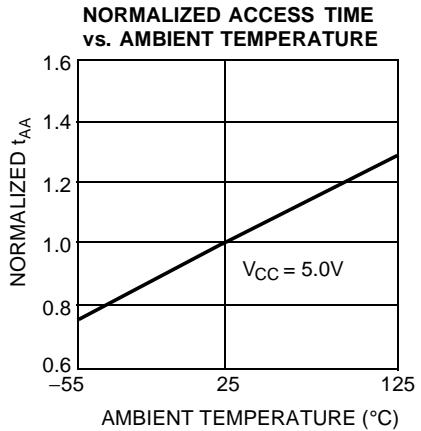

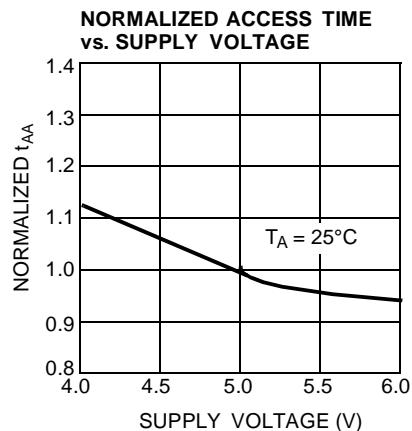

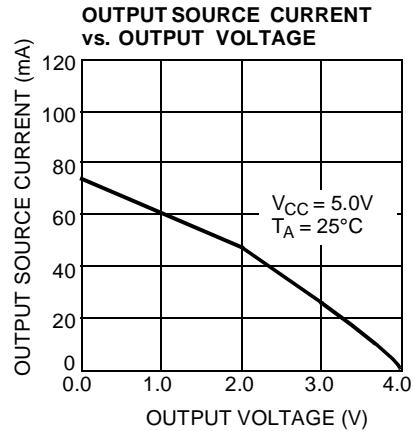

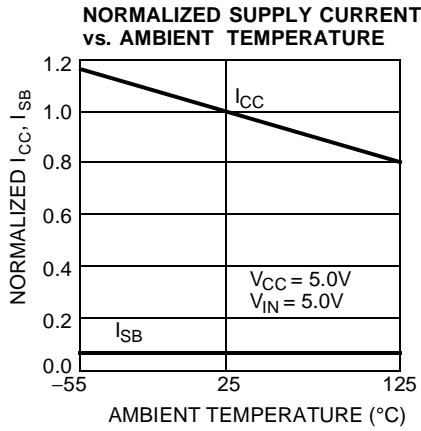

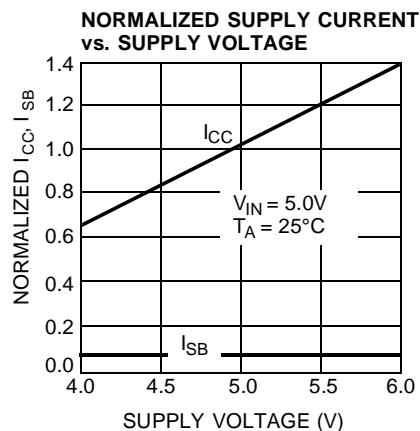

Notes:

6. Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified I_{OL}/I_{OH} and 30-pF load capacitance.
7. At any given temperature and voltage condition, t_{HZ} is less than t_{LZ} for all devices. Transition is measured ± 500 mV from steady state voltage with specified loading in part (b) of AC Test Loads and Waveforms.
8. t_{HZCE} and t_{HZWE} are tested with $C_L = 5$ pF as in part (a) of Test Loads and Waveforms. Transition is measured ± 500 mV from steady state voltage.
9. The internal write time of the memory is defined by the overlap of \overline{CE} LOW and \overline{WE} LOW. Both signal must be LOW to initiate a write and either signal can terminate a write by going high. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.
10. WE is HIGH for read cycle.
11. Device is continuously selected, $\overline{CE} = V_{IL}$.

Notes:

- 12. Address valid prior to or coincident with **CE** transition LOW.
- 13. If **CE** goes HIGH simultaneously with **WE** HIGH, the output remains in a high-impedance state.
