# 5-TAP, TTL-INTERFACED FIXED DELAY LINE (SERIES DDU222F)

#### **FEATURES**

- Five equally spaced outputs
- Very narrow device (SIP package)
- Stackable for PC board economy
- Input & outputs fully TTL interfaced & buffered
- 10 T<sup>2</sup>L fan-out capability

#### **FUNCTIONAL DESCRIPTION**

The DDU222F-series device is a 5-tap digitally buffered delay line. The signal input (IN) is reproduced at the outputs (T1-T5), shifted in time by an amount given by the device dash number. For dash numbers less than 25, the total delay of the line is measured from T1 to T5, with the nominal value given by the dash number. The nominal tap-to-tap delay increment

IN Signal Input
T1-T5 Tap Outputs
VCC +5 Volts
GND Ground

PIN DESCRIPTIONS

is given by 1/4 of this number. The inherent delay from IN to T1 is nominally 3.5ns. For dash numbers greater than or equal to 25, the total delay of the line is measured from IN to T5, with the nominal value given by the dash number. The nominal tap-to-tap delay increment is given by 1/5 of this number.

### **SERIES SPECIFICATIONS**

• Minimum input pulse width: 40% of total delay

Output rise time: 2ns typical
 Supply voltage: 5VDC ± 5%

• Supply current: I<sub>CCL</sub> = 32ma typical

 $I_{CCH} = 7$ ma typical

• Operating temperature: 0° to 70° C

Temp. coefficient of total delay: 100 PPM/°C

## **APPLICATION NOTES**

## HIGH FREQUENCY RESPONSE

The DDU222F tolerances are guaranteed for input pulse widths and periods greater than those specified in the test conditions. Although the device will function properly for pulse widths as small as 40% of the total delay and periods as small as 80% of the total delay (for a symmetric input), the delays may deviate from their values at low frequency. However, for a given input condition, the deviation will be repeatable from pulse to pulse. Contact technical support at Data Delay Devices if your application requires device testing at a specific input condition.

#### POWER SUPPLY BYPASSING

The DDU222F relies on a stable power supply to produce repeatable delays within the stated tolerances. A 0.1uf capacitor from VCC to GND, located as close as possible to the VCC pin, is recommended. A wide VCC trace and a clean ground plane should be used.
