## 10CH SELECTOR FOR CORDLESSPHONE

The DMD5602 channel selector is a CMOS integrated circuit designed specifically to select 10 channels used in 46/49MHz cordless phones. This device has programmable counter, reference frequency generator, ROM for the transmit and receive loop, and phase detector

### FEATURES

- 10channel selection with 4-Bit data input
- On-chip oscillator with external crystal (10.24MHz)
- Lock detect signal
- Standby Operation for power savings
- Operating Voltage range : 2.5V~5.5V
- Maximum operating frequency : 60MHz,  $V_{in} = 200mV_{p-p}$

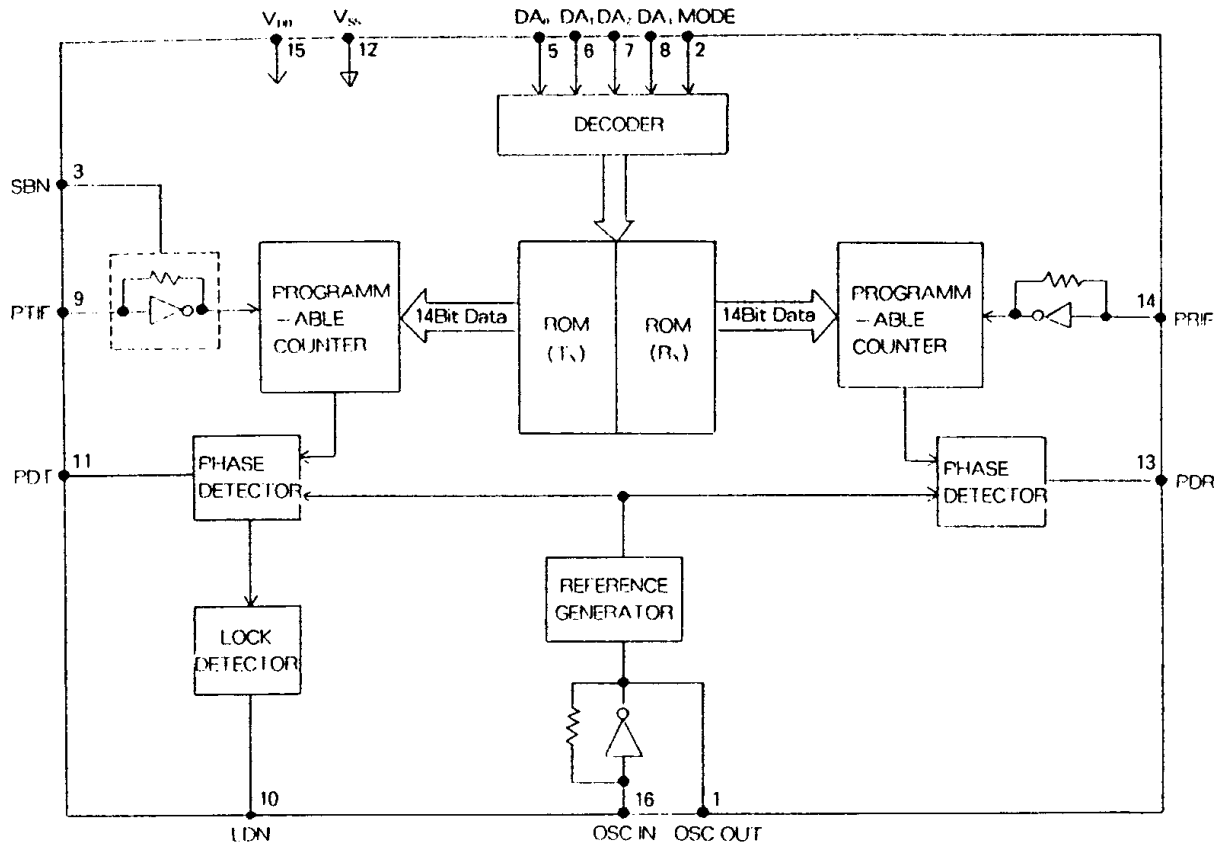

### MAXIMUM RATINGS( $T_a = 25^\circ C$ )

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	$V_{DD}$	-0.5~6.0	V
Input Voltage ( All Inputs)	$V_{IN}$	$\sim 0.3 \sim V_{DD} + 0.5$	V
Output Current (LDN)	$I_{out}$	0~3.0	mA
Power Dissipation ( $V_{DD} = 5V$ )	$P_D$	27	mw
Operating Temperature	$T_{our}$	-30~+75	$^\circ C$
Storage Temperature	$T_{sg}$	-65~+150	$^\circ C$

## □ BLOCK DIAGRAM

## □ PIN CONFIGURATION

# DMD 5602

## □ PIN DESCRIPTION

PIN		I/O	DESCRIPTION
NAME	NO		
OSC IN	16	I	These pins form a reference oscillator when connected to an external parallel resonant crystal( 10.24MHz)
OSC OUT	1	O	
MODE	2	I	This pin is for selecting handset/base mode. When mode is high, the device is base mode. When mode is low, the device handset mode. This input is normally pull-downed.
SBN	3	I	This pin is used to save power consumption when not transmitting. When SBN is high, both the transmit and receive loops are in operation. When SBN is low, but the transmit loop is disabled. This input is normally pull-downed.
	4	O	No connection
DA0	5	I	These pins are used to select one of 10 channels. The frequency assignments are shown in Table 1 and 2. These pins are normally pull-downed.
DA1	6		
DA2	7		
DA3	8		
PTIF	9	I	This is input to programmable counter for transmit loop. This signal is typically derived from the loop VCO and AC coupled. For large signal, it needs DC coupling. The minimum input voltage is $200mV_{P-P}$ .
LDN	10	O	This pin is used to indicate an unlock condition. it is a p-channel open-drain output.
PDT	11	O	This is 3-state output of the transmit phase detector for use as loop error signals.
V <sub>SS</sub>	12	power	Ground for all internal circuits.
PDR	13	O	This is 3-state output of the receive phase detector for use as loop error signals.
PRIF	14	I	This is input to programmable counter for receive loop. This signal is typically derived from the loop VCO and AC coupled. For large signal, it needs DC coupling. The minimum input voltage is $200mV_{P-P}$ .
V <sub>DD</sub>	15	power	Postive supply voltage.
