INNOVATION and EXCELLENCE

DTL Series DTL2A Model

100 Watt, Digitally Programmable Serial-Input, Electronic Loads

Features

- 12-bit, optically isolated (500Vdc), CMOS/TTL-compatible serial input
- 0-20 Amp output in 5mA increments
- 10M Ω minimum output impedance
- Output voltage to 50 Volts
- Output power to 100 Watts
- $\pm 5\text{mA}$ offset error; $\pm 0.1\%$ gain error
- 100 μsec full-scale step response
- Update rates to 20kHz
- Operate in parallel for higher power
- Miniature, 2" x 2" metal package

Applications

- Static/dynamic power-supply burn-in
- Power-supply test and characterization
- Battery capacity testing
- Current-source testing
- Capacitor discharge testing
- Real-time load simulation

DATEL's new DTL2A is an optically isolated, digitally programmable, serial-input, electronic load. It is essentially a digitally controlled current source that can sink currents from 0 to 20 Amps, at loading voltages from 2.5 to 50 Volts, up to a maximum power of 100 Watts. The DTL2A is packaged in a thermally efficient, 2" x 2" x 0.5" metal package that incorporates an aluminum baseplate with through-hole spacers for easy pcb mounting and/or external heat-sink attachment.

The DTL2A accepts a serialized, 12-bit, CMOS/TTL-compatible, digital input word easily generated by any standard digital I/O card. The DTL2A buffers and then optically isolates (500Vdc) the digital input data before storing it in a register and presenting it to an on-board, 12-bit, digital-to-analog (D/A) converter. The D/A output drives a near-ideal (10M Ω minimum output impedance), voltage-controlled current source. One LSB (least significant bit) of the D/A converter corresponds to a 5mA increment (0.025% of 20A) in load current.

The DTL2A features a max. $\pm 5\text{mA}$ offset error and a max. $\pm 0.1\%$ gain error. It has an impressive full-scale step response time of 100 μsec and can be operated dynamically at update rates up to 20kHz. Powered by a single +5V supply, the DTL2A draws a mere 150mA (maximum).

While operating in the constant-current mode up to 20 Amps (100W max. power), the output compliance voltage of the DTL2A is 2.5 to 50 Volts. Should the output/load voltage drop below the 2.5V minimum required for proper biasing, an internal monitoring circuit activates the DTL2A's output Fault line. See DATEL's DTL2A-LC for compliance voltages as low as 0.6V.

DTL2A's and other electronic loads, controller boards, and software from DATEL are outstanding building-block components for power-supply burn-in and test systems. They are an extremely reliable, cost-effective solution that enables you to quickly configure impressively accurate systems.

The horizontal axis of the above chart references the temperature of the DTL2A's aluminum baseplate. The device can continually dissipate up to 100 Watts if the baseplate is maintained at or below +50°C. At +25°C ambient temperature, with no heat sink or supplemental air flow, the DTL2A can reliably dissipate a continuous 10 Watts.

TECHNICAL NOTES

Overview

The DTL2A is a digitally programmable, CMOS/TTL-compatible, serial-input current sink. It's output/load current range is 0 to 20 Amps (in 4.88mA increments), over a compliance voltage range of 2.5 to 50 Volts and an output/load power range of 0 to 100 Watts. The device's digital I/O coding is straight binary (see table below). A digital input of all "0's" forces a load current of 0 Amps. A digital input of all "1's" forces a load current of 19.995 Amps.

In a typical power-supply test or burn-in application, the output pins of the device under test (DUT) are connected to the DTL2A's +Load (pins 10 and 11) and -Load (pins 8 and 9) outputs. The DTL2A's operation is controlled by its four digital input lines (Serial Data In, Clock, Latch Data and Control Strobe).

Mapping of the Serial-Input Data to Load Current

Initialization

Preparing the DTL2A to accept new digital data is accomplished by applying logic "1's" to $\overline{\text{Control Strobe}}$ ($\overline{\text{CS}}$, pin 7), $\overline{\text{Latch Data}}$ ($\overline{\text{LD}}$, pin 4) and Clock (CLK, pin 6) with all signals present and stable for a minimum of 1 μsec . During this interval, it does not matter whether or not data is present on the Serial Data In (SDI, pin 5) line.

Serial Data

Following initialization, the 12-bit digital word representing the desired output current is applied to the SDI pin. The serial data should appear starting with the most significant bit (MSB, bit 1, D11) and ending with the least significant bit (LSB, bit 12, D0). With each data bit present and stable on the SDI line, the CLK must be toggled through a low-to-high transition to register that bit. Twelve rising clock edges, at rates up to 500kHz, are required to clock all 12 digital bits into the DTL2A's input register.

Latching Data and Presenting It to the D/A

After loading the LSB, the serial data word is latched by bringing the $\overline{\text{Control Strobe}}$ (pin 7) high and then toggling the $\overline{\text{Latch Data}}$ pin (pin 4) through a high-low-high sequence. Approximately 100 μsec later, the output current will settle to its final desired value.

Software: C Language

The following steps describe a typical timing sequence when using the DTL2A's 4 digital inputs and a programming language such as C. Using 4 bits of a typical 8-bit port, assign BIT_0 to the $\overline{\text{Control Strobe}}$ ($\overline{\text{CS}}$, pin 7), BIT_1 to $\overline{\text{Latch Data}}$ ($\overline{\text{LD}}$, pin 4), BIT_2 to Serial Data In (SDI, pin 5), and BIT_3 to the Clock (CLK, pin 6).

1. Initialize with $\overline{\text{Control Strobe}}$, $\overline{\text{Latch Data}}$, and Clock high:
BIT_0 = 1, BIT_1 = 1, BIT_2 = X (don't care), BIT_3 = 1
2. Bring the $\overline{\text{Control Strobe}}$ low.
BIT_0 = 0
3. Apply the MSB (D11) of the serial data word to Serial Data In.
BIT_2 = 0 or 1
4. Toggle the Clock high-low-high.
BIT_3 = 1 to 0 to 1
5. Apply D10 of the serial data word to Serial Data In.
BIT_2 = 0 or 1
6. Toggle the Clock high-low-high.
BIT_3 = 1 to 0 to 1
7. Repeat the process for remaining data bits D9 through D0.
8. Drive the $\overline{\text{Control Strobe}}$ high.
BIT_0 = 1
9. Toggle the $\overline{\text{Latch Data}}$ input high-low-high.
BIT_1 = 1 to 0 to 1.

Output Compliance Voltage and the Fault Line

For proper operation, the DTL2A's output/load voltage must always be between 2.5 and 50 Volts. The device cannot be used to directly load low-voltage, e.g. 1.8V or 2.5V, power components or to simulate a true short circuit (0 Volts). Voltages greater than 50V can damage the device. Voltages <2.5V will result in insufficient biasing of the output current source and consequently unpredictable or no operation. Accordingly, we have installed an internal output/load-voltage monitoring circuit. If the output/load voltage drops below 2.5V and the DTL2A's output is at risk of becoming disabled, the Fault line activates.

The Fault line is an optically isolated, active-low function with an open-collector output (internal 10k Ω pull-up resistor to +5V). Under normal conditions, its output is high (logic "1"). Under fault conditions ($V_{\text{OUT}} < 2.5\text{V}$), its output drops to a logic "0." There is no output/load-voltage monitoring circuit for voltages greater than 50V, and operation above 50V can damage the device.

An "offset supply" can be inserted between the DTL2A's -Load output (pins 8 and 9) and the power device under test (DUT) to "translate" the DTL2A's 47.5V output/load voltage range. The offset supply must have adequate current capabilities and be connected with the polarities indicated in Figure 2 below. Under no circumstances should the voltage across the DTL2A's output be allowed to experience a polarity reversal.

If a 5V/20A offset supply is inserted as shown, the range of DUT voltages will be -2.5 to +45 Volts. Such a configuration can be used for true short-circuit testing. A mechanical relay can be used to short the outputs of the DUT while the offset supply ensures the DTL2A always sees at least 5 Volts across its outputs.

Figure 2. An "Offset Supply" Enables True Short-Circuit Testing

Thermal Considerations

The DTL2A can reliably handle 100W loads if its case temperature is maintained at or below +50°C. With no heat sinking or auxiliary cooling, the device can only handle loads up to 10 Watts.
