Preliminary

GENERAL DESCRIPTION

EM73461B is an advanced single chip CMOS 4-bit micro-controller. It contains 4K/8K-byte ROM, 244-nibble RAM, 4-bit ALU, 13-level subroutine nesting, 22-stage time base, two 12-bit timer/counters for the kernel function. EM73461B also contains 6 interrupt sources, 1 input port, 2 bidirection ports, LCD display (32x4), and one high speed timer/counter with melody output.
EM73461B has plentiful operating modes (SLOW, IDLE, STOP) intended to reduce the power consumption.

FEATURES

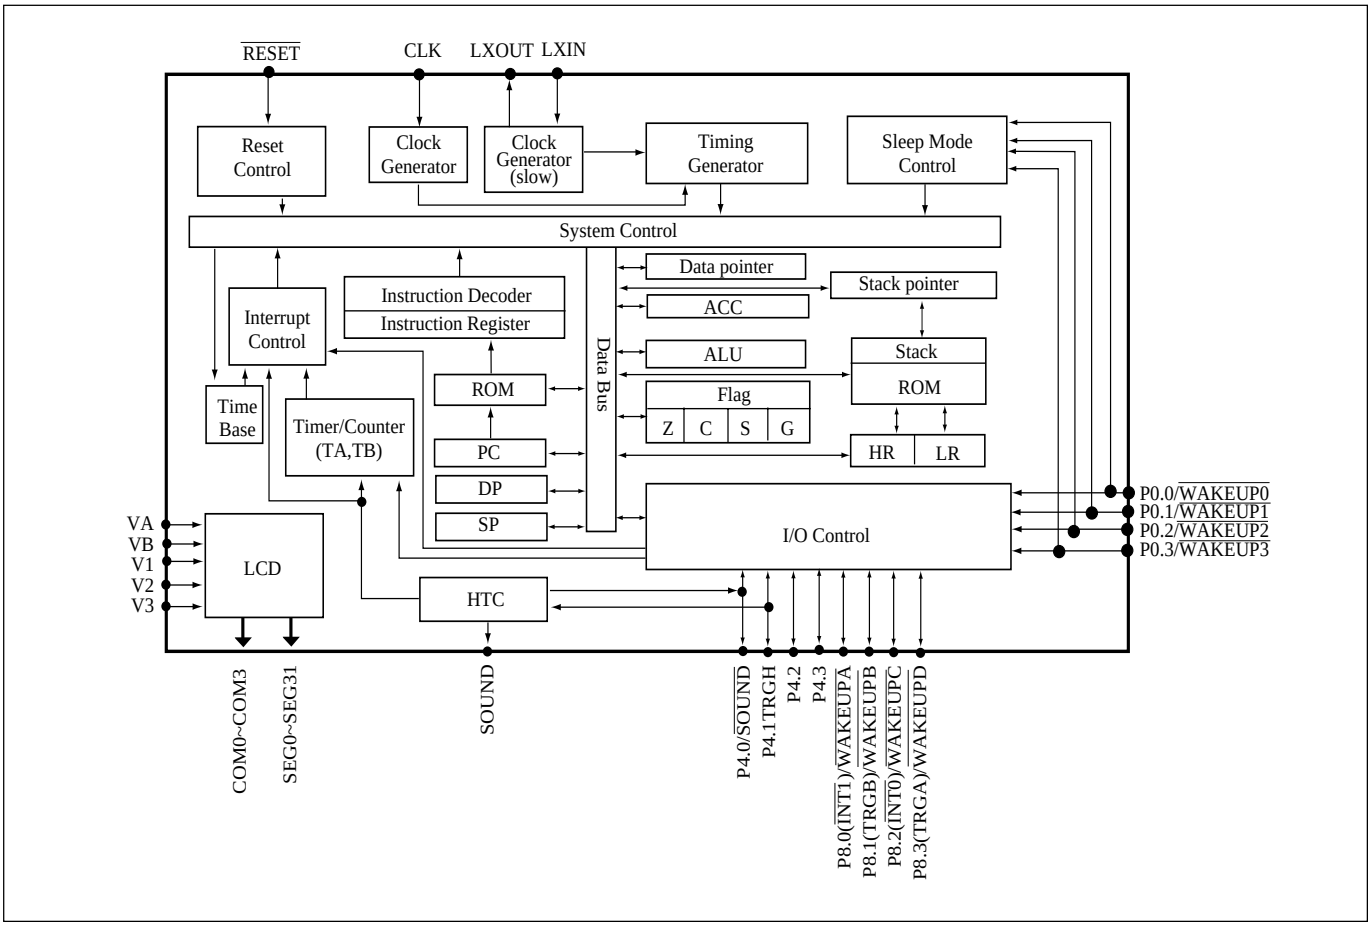
- Operation voltage : 2.4V to 3.6V.
- Clock source : Dual clock system. Low-frequency oscillator is Crystal or RC oscillator (32K Hz, connect an external resistor) by mask option and high-frequency oscillator is RC oscillator (connect an external resistor), or built-in internal oscillator.
- Instruction set : 109 powerful instructions for 4K ROM / 107 powerful instructoins for 8K ROM.
- Instruction cycle time : 0.85μs for 9.2M or 1.7μs for 4.6M or 2μs for 4MHz. Selected by mask option (high speed clock).
  122 μs or 244μs by frequency double mask option for 32768 Hz (low speed clock).
- ROM capacity : 4096 X 8 bits / 8192 X 8 bits ROM are choosed by mask option.
- RAM capacity : 244 X 4 bits.
- Input port : 1 port (P0). P0(0..3) and IDLE releasing function are available by mask option.
- Bidirection port : 2 ports (P4, P8). P4.0 and $\overline{\text{SOUND}}$ is available by mask option. P4.1 is shared with HTC external input. P8(0..3) and IDLE releasing function are available by mask option.
- 12-bit timer/counter : Two 12-bit timer/counters are programmable for timer, event counter and pulse width measurement.
- High speed timer/counter : One 8-bit high speed timer/counters is programmable for auto load timer, melody output and pulse width measurement.
- Built-in time base counter : 22 stages.
- Subroutine nesting : Up to 13 levels.
- Interrupt : External . . . . . 2 input interrupt sources.
  Internal . . . . . 2 Timer overflow interrupts, 1 time base interrupt.
  1 high speed timer overflow interrupt.
- LCD driver : 32 X 4 dots, 1/4duty, 1/3duty, 1/2duty, static, 1/2 bias, 1/3 bias; 6 options selectable.
- Power saving function : SLOW, IDLE, STOP operation mode.
- Package type : Chip form 61 pins.

APPLICATIONS

EM73461B is suitable for application in family applicance, consumer products, hand held games and the toy controller.

Preliminary

FUNCTION BLOCK DIAGRAM



PIN DESCRIPTIONS

Symbol	Pin-type	Function
V_{DD}		Power supply (+)
V_{SS}		Power supply (-)
RESET	RESET-A	System reset input signal, low active mask option : none pull-up
CLK	OSC-I/OSC-G	RC clock source or capacitor connecting pin for high frequency oscillator
LXIN	OSC-B/OSC-H1	Crystal/RC connecting pin for low speed clock source
LXOUT	OSC-B	Crystal connecting pin for low speed clock source
P0(0..3)/WAKEUP0..3	INPUT-K	4-bit input port with IDLE releasing function mask option : wakeup enable, negative edge release, pull-up wakeup enable, negative edge release, none wakeup enable, positive edge release, pull-down wakeup enable, positive edge release, none wakeup disable, pull-up wakeup disable, pull-down wakeup disable, none
P4.0/SOUND	I/O-R	1-bit bidirection I/O port or inverse sound effect output mask option : SOUND enable, high current push-pull SOUND disable, open-drain

Preliminary

PIN DESCRIPTIONS

Symbol	Pin-type	Function
		$\overline{\text{SOUND}}$ disable, low current push-pull $\overline{\text{SOUND}}$ disable, normal current push-pull $\overline{\text{SOUND}}$ disable, high current push-pull
P4.1/TRGH	I/O-T	1-bit bidirection I/O port with HTC external input mask option : NMOS open-drain PMOS open-drain low current push-pull normal current push-pull high current push-pull
P4(2,3)	I/O-R	2-bit bidirection I/O port with high current source mask option : NMOS open-drain PMOS open-drain low current push-pull normal current push-pull high current push-pull
P8.0($\overline{\text{INT1}}$)/$\overline{\text{WAKEUPA}}$, P8.2($\overline{\text{INT0}}$)/$\overline{\text{WAKEUPC}}$	I/O-S	2-bit bidirection I/O port with external interrupt source input and IDLE releasing function mask option : wakeup enable, low current push-pull wakeup enable, normal current push-pull wakeup disable, open-drain wakeup disable, low current push-pull wakeup disable, normal current push-pull
P8.1(TRGB)/$\overline{\text{WAKEUPB}}$ P8.3(TRGA)/$\overline{\text{WAKEUPD}}$	I/O-S	2-bit bidirection I/O port with time/counter A,B external input and IDLE releasing function mask option : wakeup enable, low current push-pull wakeup enable, normal current push-pull wakeup disable, open-drain wakeup disable, low current push-pull wakeup disable, normal current push-pull
SOUND		Melody output
VA,VB, V1, V2, V3		Connect the capacitors for LCD bias voltage
COM0~COM3		LCD common output pins
SEG0~SEG31		LCD segment output pins
TEST		Tie Vss as package type, no connecting as COB type.

FUNCTION DESCRIPTIONS

PROGRAM ROM (4K X 8 bits)

4 K x 8 bits program ROM contains user's program and some fixed data.
The basic structure of program ROM can be divided into 5 parts.
1. Address 000h: Reset start address.
2. Address 002h - 00Ch : 6 kinds of interrupt service routine entry addresses.
3. Address 00Eh-086h : SCALL subroutine entry address, only available at 00Eh,016h,01Eh,026h, 02Eh, 036h, 03Eh, 046h, 04Eh, 056h, 05Eh, 066h, 06Eh, 076h, 07Eh, 086h.
4. Address 000h - 7FFh : LCALL subroutine entry address.
5. Address 000h - FFFh : Except used as above function, the other region can be used as user's program region.

Preliminary

address	4096 x 8 bits
000h	Reset start address
002h	INT0; External interrupt service routine entry address
004h	HTCI; High speed timer interrupt service entry address
006h	TRGA; Timer/counterA interrupt service routine entry address
008h	TRGB; Timer/counter B interrupt service routine entry address
00Ah	TBI; Time base interrupt service routine entry address
00Ch	INT1; External interrupt service routine entry address
00Eh 086h	SCALL, subroutine call entry address
⋮	⋮
FFFh	

User's program and fixed data are stored in the program ROM. User's program is according the PC value to send next executed instruction code. Fixed data can be read out by table-look-up instruction.

Table-look-up instruction :

Table -look-up instruction is depended on the Data Pointer (DP) to indicate to ROM address, then to get the ROM code data.

LDAX **Acc ← ROM[DP]$_L$**
LDAXI **Acc ← ROM[DP]$_H$,DP+1**

DP is a 12-bit data register which can store the program ROM address to be the pointer for the ROM code data. First, user load ROM address into DP by instruction "STADPL, STADPM, STADPH", then user can get the lower nibble of ROM code data by instruction "LDAX" and higher nibble by instruction "LDAXI".

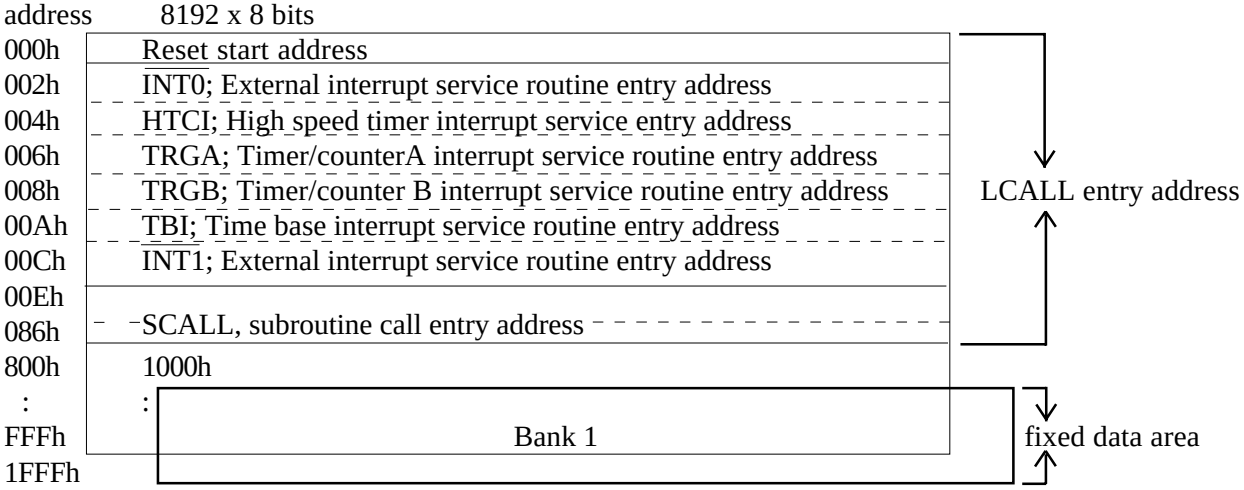
PROGRAM EXAMPLE: Read out the ROM code of address 777h by table-look-up instruction.

```
LDIA #07h;
STADPL      ; DP3-0 ← 07h
STADPM      ; DP5-4 ← 07h
STADPH      ; DP8-6 ← 07h, Load DP=777h
:
LDL #00h;
LDH #03h;
LDAX        ; ACC ← 6h
STAMI       ; RAM[30] ← 6h
LDAXI       ; ACC ← 5h
STAM        ; RAM[31] ← 5h
;
ORG 777h
DATA 56h;
:
```

Preliminary

PROGRAM ROM (8K X 8 bits)

8 K x 8 bits program ROM contains user's program and some fixed data .
The basic structure of program ROM can be divided into 6 parts.
1. Address 0000h: Reset start address.
2. Address 0002h - 000Ch : 6 kinds of interrupt service routine entry addresses .
3. Address 000Eh - 0086h : SCALL subroutine entry address, only available at 000Eh, 0016h, 001Eh, 0026h, 002Eh, 0036h, 003Eh, 0046h, 004Eh, 0056h, 005Eh, 0066h, 006Eh, 0076h, 007Eh, 0086h.
4. Address 0000h - 07FFh : LCALL subroutine entry address.
5. Address 0000h - 1FFFh : Except used as above function, the other region can be used as user's program region.
6. Address 1000h - 1FFFh : Fixed data stortage area.



User's program and fixed data are stored in the program ROM. User's program is according the PC value to send next executed instruction code. Fixed data can be read out by table-look-up instruction.
Please note that fixed data only can be stored in 8K ROM Bank 1.
The program counter is a 13-bit binary counter. The PC can defined 8K ROM.

Table-look-up instruction :

Table -look-up instruction is depended on the Data Pointer (DP) to indicate to ROM address, then to get the ROM code data.

LDAX **Acc ← ROM[DP]$_L$**
LDAXI **Acc ← ROM[DP]$_H$,DP+1**

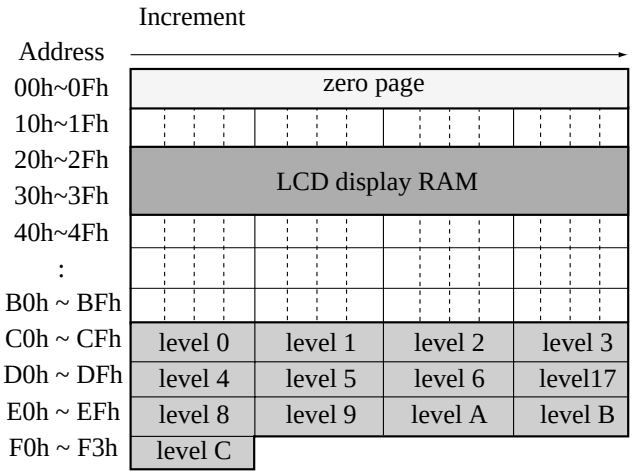
DP is a 13-bit data register which can store the program ROM address to be the pointer for the ROM code data. First, user load ROM address into DP by instruction "STADPL, STADPM, STADPH", then user can get the lower nibble of ROM code data by instruction "LDAX" and higher nibble by instruction "LDAXI".

PROGRAM EXAMPLE: Read out the ROM code of address 1777h by table-look-up instruction for 8K ROM.

```
LDIA #07h;
STADPL      ; DP3-0 ← 07h
STADPM      ; DP5-4 ← 07h
STADPH      ; DP8-6 ← 07h, Load DP=1777h
:
LDL #00h;
LDH #03h;
LDAX        ; ACC ← 6h
STAMI       ; RAM[30] ← 6h
LDAXI       ; ACC ← 5h
STAM        ; RAM[31] ← 5h
;
BANK 1;
ORG 1777h
DATA 56h;
:
```

DATA RAM (244-nibble)

There is total 244 - nibble data RAM from address 00 to F3h
Data RAM includes 3 parts: zero page region, stacks and data area.



LCD display RAM:

RAM address from 20h ~ 3Fh are the LCD display RAM area, the RAM data of this region can't be operated by instruction LDHL xx and EXHL.

ZERO-PAGE:

From 00h to 0Fh is the location of zero-page. It is used as the pointer in zero-page addressing mode for the instruction of "STD #k,y; ADD #k,y; CLR y,b; CMP k,y".

PROGRAM EXAMPLE: To wirte immediate data "07h" to address "03h" of RAM and to clear bit 2 of RAM.

```
STD #07h, 03h ; RAM[03] ← 07h
CLR 0Eh,2 ; RAM[0Eh]2 ← 0
```

STACK:

There are 13-level (maximum) stack for user using for subroutine (including interrupt and CALL). User can assign any level be the starting stack by giving the level number to stack pointer (SP).
When user using any instruction of CALL or subroutine, before entry the subroutine, the previous PC address will be saved into stack until return from those subroutines, the PC value will be restored by the data saved in stack.

DATA AREA:

Except the special area used by user, the whole RAM can be used as data area for storing and loading general data.

ADDRESSING MODE

(1) Indirect addressing mode:
Indirect addressing mode indicates the RAM address by specified HL register.
For example: LDAM ; Acc ← RAM[HL]
STAM ; RAM[HL] ← Acc

(2) Direct addressing mode:
Direct addressing mode indicates the RAM address by immediate data.
For example: LDA x ; Acc← RAM[x]
STA x ; RAM[x] ← Acc

(3) Zero-page addressing mode
For zero-page region, user can using direct addressing to write or do any arithematic, comparsion or bit manupulated operation directly.
For example: STD #k,y ; RAM[y] ← #k
ADD #k,y; RAM[y] ← RAM[y] + #k

Preliminary

PROGRAM COUNTER (4K/8K ROM)

Program counter (PC) is composed by a 12-bit counter for 4K ROM/13-bit counter for 8K ROM which indicates the next executed address for the instruction of program ROM.
For a 4K - byte size ROM, PC can indicate address form 000h - FFFh, for BRANCH and CALL instrcutions, PC is changed by instruction indicating.
For a 8K - byte size ROM, PC can indicate address form 0000h - 1FFFh, for BRANCH and CALL instrcutions, PC is changed by instruction indicating.

(1) Branch instruction:

SBR a
Object code: 00aa aaaa
Condition: SF=1; PC ← $PC_{11\text{-}6.a}$ (branch condition satisified)

PC | Hold original PC value+1 | a | a | a | a | a | a | (for 4K/8K ROM)

SF=0; PC ← PC +1(branch condition not satisified)

PC | Original PC value + 1 |

LBR a
Object code: 1100 aaaa aaaa aaaa
Condition: SF=1; PC ← a (branch condition satisified)

PC | a | a | a | a | a | a | a | a | a | a | a | a | (for 4K/8K ROM)

SF=0 ; PC ← PC + 2 (branch condition not satisified)

PC | Original PC value + 2 |

SLBR a
Object code: 0101 0101 1100 aaaa aaaa aaaa (a : 1000 ~ 1FFFh)
0101 0111 1100 aaaa aaaa aaaa (a : 0000 ~ 0FFFh)
Condition: SF=1; PC ← a (branch condition satisified)

PC | a | a | a | a | a | a | a | a | a | a | a | a | (only for 8K ROM)

SF=0 ; PC ← PC + 2 (branch condition not satisified)

PC | Original PC value + 2 |

Preliminary

(2) Subroutine instruction:

SCALL a
Object code: 1110 nnnn
Condition : PC ← a ; a=8n+6 ; n=1..15 ; a=86h, n=0

PC	0	0	0	0	a	a	a	a	a	a	a	a

LCALL a
Object code: 0100 0 aaa aaaa aaaa
Condition: PC ← a

PC	0	a	a	a	a	a	a	a	a	a	a	a

RET
Object code: 0100 1111
Condition: PC ← STACK[SP]; SP + 1

PC	The return address stored in stack	(for 4K ROM)
PC	The return address stored in stack	(for 8K ROM)

RT I
Object code: 0100 1101
Condition : FLAG. PC ← STACK[SP]; EI ← 1; SP + 1

PC	The return address stored in stack	(for 4K ROM)
PC	The return address stored in stack	(for 8K ROM)

(3) Interrupt acceptance operation:

When an interrupt is accepted, the original PC is pushed into stack and interrupt vector will be loaded into PC,The interrupt vectors are as following:

$\overline{\text{INT0}}$ (External interrupt from P8.2)

PC	0	0	0	0	0	0	0	0	0	0	1	0	(for 4K ROM)
PC	0	0	0	0	0	0	0	0	0	0	0	1	0	(for 8K ROM)

TRGA (Timer A overflow interrupt)

PC	0	0	0	0	0	0	0	0	0	1	1	0	(for 4K ROM)
PC	0	0	0	0	0	0	0	0	0	0	1	1	0	(for 8K ROM)

TRGB (Time B overflow interrupt)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | (for 4K ROM)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | (for 8K ROM)

TBI (Time base interrupt)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | (for 4K ROM)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 | (for 8K ROM)

$\overline{\text{INT1}}$ (External interrupt from P8.0)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | (for 4K ROM)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | (for 8K ROM)

(4) Reset operation:

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | (for 4K ROM)

PC | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | (for 8K ROM)

(5) Other operations:

For 1-byte instruction execution: PC + 1
For 2-byte instruction execution: PC + 2

ACCUMULATOR

Accumulator is a 4-bit data register for temporary data. For the arithematic, logic and comparative opertion .., ACC plays a role which holds the source data and result.

FLAGS

There are four kinds of flag, CF (Carry flag), ZF (Zero flag), SF (Status flag) and GF (General flag), these 4 1-bit flags are affected by the arithematic, logic and comparative .... operation.
All flags will be put into stack when an interrupt subroutine is served, and the flags will be restored after RTI instruction executed.

(1) Carry Flag (CF)

The carry flag is affected by following operation:

a. Addition : CF as a carry out indicator, when the addition operation has a carry-out, CF will be "1", in another word, if the operation has no carry-out, CF will be "0".

b. Subtraction : CF as a borrow-in indicator, when the subtraction operation must has a borrow, in the CF will be "0", in another word, if no borrow-in, CF will be "1".

c. Comparision: CF is as a borrow-in indicator for Comparision operation as the same as subtraction operation.

d. Rotation: CF shifts into the empty bit of accumulator for the rotation and holds the shift out data after rotation.

e. CF test instruction : For TFCFC instruction, the content of CF sends into SF then clear itself "0". For TTSFC instruction, the content of CF sends into SF then set itself "1".

(2) Zero Flag (ZF)

ZF is affected by the result of ALU, if the ALU operation generate a "0" result, the ZF will be "1", otherwise, the ZF will be "0".

(3) Status Flag (SF)

The SF is affected by instruction operation and system status.

a. SF is initiated to "1" for reset condition.

b. Branch instruction is decided by SF, when SF=1, branch condition will be satisified, otherwise, branch condition will not be satisified by SF = 0.

@(4) General Flag (GF)

GF is a one bit general purpose register which can be set, clear, test by instruction SGF, CGF and TGS.

PROGRAM EXAMPLE:
Check following arithematic operation for CF, ZF, SF

@ : just for 4K ROM.

Preliminary

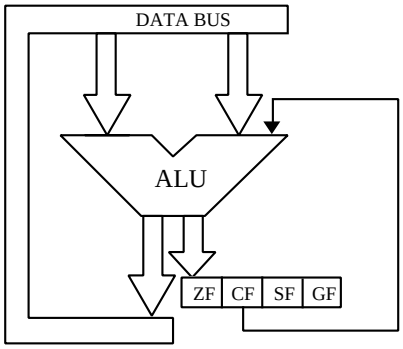
	CF	ZF	SF
LDIA #00h;	-	1	1
LDIA #03h;	-	0	1
ADDA #05h;	-	0	1
ADDA #0Dh;	-	0	0
ADDA #0Eh;	-	0	0

ALU

The arithematic operation of 4 - bit data is performed in ALU unit. There are 2 flags can be affected by the result of ALU operation, ZF and SF. The operation of ALU can be affected by CF only.

ALU STRUCTURE

ALU supported user arithematic operation function, including : addition, subtraction and rotaion.



ALU FUNCTION

(1) Addition:

For instruction ADDAM, ADCAM, ADDM #k, ADD #k,y .... ALU supports addition function. The addition operation can affect CF and ZF. For addition operation, if the result is "0", ZF will be "1", otherwise, not equal "0", ZF will be "0". When the addition operation has a carry-out, CF will be "1", otherwise, CF will be "0".

EXAMPLE:

Operation	Carry	Zero
3+4=7	0	0
7+F=6	1	0
0+0=0	0	1
8+8=0	1	1

(2) Subtraction:

For instruction SUBM #k, SUBA #k, SBCAM, DECM... ALU supports user subtraction function. The subtraction operation can affect CF and ZF, For subtraction operation, if the result is negative, CF will be "0", it means a borrow out, otherwise, if the result is positive, CF will be "1". For ZF, if the result of subtraction operation is "0", the ZF will be "1", otherwise, ZF will be "1".

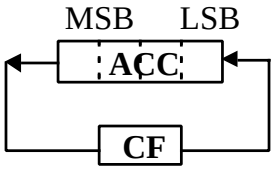
Preliminary

EXAMPLE:

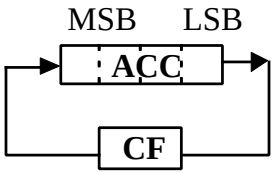
Operation	Carry	Zero
8-4=4	1	0
7-F= -8(1000)	0	0
9-9=0	1	1

(3) Rotation:

There are two kinds of rotation operation, one is rotation left, the other is rotation right.
RLCA instruction rotates Acc value to left, shift the CF value into the LSB bit of Acc and the shift out data will be hold in CF.



RRCA instruction operation rotates Acc value to right, shift the CF value into the MSB bit of Acc and the shift out data will be hold in CF.



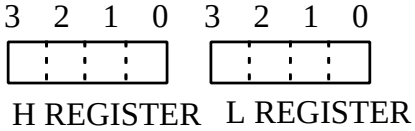
PROGRAM EXAMPLE: To rotate Acc right and shift a "1" into the MSB bit of Acc.

TTCFS; CF ← 1
RRCA; rotate Acc right and shift CF=1 into MSB.

HL REGISTER

HL register are two 4-bit registers, they are used as a pair of pointer for the address of RAM memory and also 2 independent temporary 4-bit data registers. For some instruction, L register can be a pointer to indicate the pin number (Port4).

HL REGISTER STRUCTURE



HL REGISTER FUNCTION

(1) For instruction : LDL #k, LDH #k, THA, THL, INCL, DECL, EXAL, EXAH, HL register used as a temporary register.

PROGRAM EXAMPLE: Load immediate data "5h" into L register, "Dh" into H register.

```
LDL #05h;
LDH #0Dh;
```

(2) For instruction LDAM, STAM, STAMI .., HL register used as a pointer for the address of RAM memory.

PROGRAM EXAMPLE: Store immediate data #Ah into RAM of address 35h.

```
LDL #5h;
LDH #3h;
STDMI #0Ah; RAM[35] ← Ah
```

(3) For instruction : SELP, CLPL, TFPL, L regieter be a pointer to indicate the bit of I/O port.

When LR = 0 indicate P4.0

PROGRAM EXAMPLE: To set bit 0 of Port4 to "1"

```
LDL #00h;
SEPL ; P4.0 ← 1
```

STACK POINTER (SP)

Stack pointer is a 4-bit register which stores the present stack level number.
Before using stack, user must set the SP value first, CPU will not initiate the SP value after reset condition . When a new subroutine is accepted, the SP will be decreased one automatically, in another word, if returning from a subroutine, the SP will be increased one.
The data transfer between ACC and SP is by instruction of "LDASP" and "STASP".

DATA POINTER (DP)

Data pointer is a 12-bit register which stores the address of ROM can indicate the ROM code data specified by user (refer to data ROM).

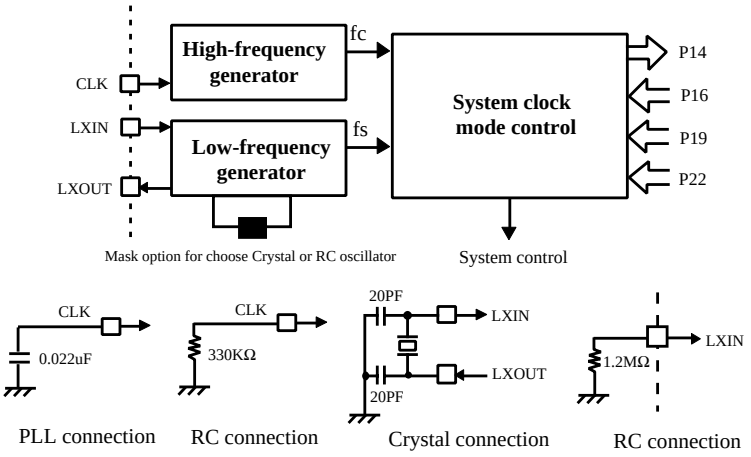
CLOCK AND TIMING GENERATOR

The clock generator is supported by a single clock system, the clock source comes from crystal (resonator) or RC oscillation is decided by mask option, the working frequency range is 480 K Hz to 4 MHz depending on the working voltage.

CLOCK GENERATOR STRUCTURE

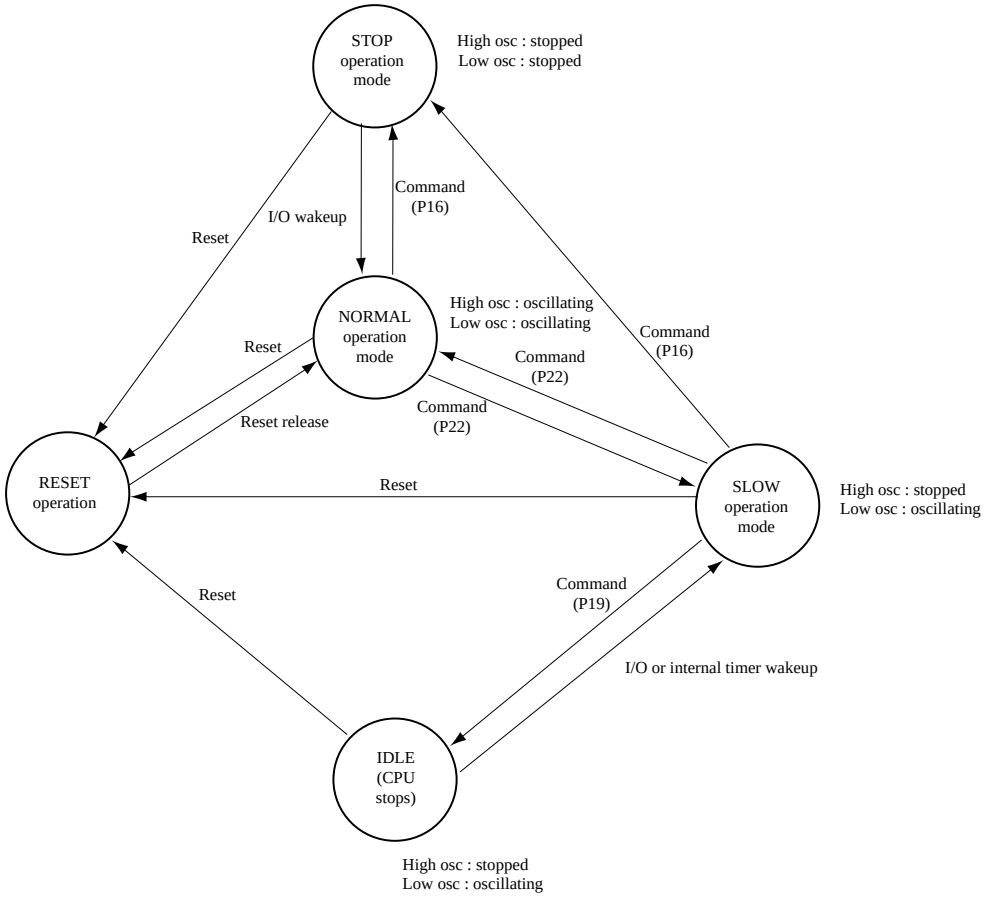
There are two clock generator for system clock control. P14 is the status register for the CPU status. P16, P19 and P22 are the system clock mode control ports.

Preliminary



SYSTEM CLOCK MODE CONTROL

The system clock mode controller can start or stop the high-frequency and low-frequency clock oscillator and switch between the basic clocks. EM73461B has four operation modes (NORMAL, SLOW,IDLE and STOP operation modes).



Operation Mode	Oscillator	System Clock	Available function	One instruction cycle
NORMAL	High, Low frequency	High frequency clock	LCD, High speed timer	8/fc
SLOW	Low frequency	Low frequency clock	LCD, High speed timer	4/fs or 8/fs by mask option
IDLE	Low frequency	CPU stops	LCD	-
STOP	None	CPU stops	All disable	-

Preliminary

NORMAL OPERATION MODE

The 4-bit µc is in the NORMAL operation mode when the CPU is reseted. This mode is a dual clock system (high-frequency(fc) and low-frequency(fs) clocks oscillating). It can be changed to SLOW or STOP operation mode by the command register (P22 or P16).
The instruction cycle is 8/fc in NORMAL operation mode.
LCD display and high speed timer/counter with melody output are available for the NORMAL operation mode.

SLOW OPERATION MODE

The SLOW operation mode is a single clock system (low-frequency(fs) clock oscillating). It can be changed to the DUAL operation mode with the commoand register (P22), STOP operation mode with P16 and IDLE operation mode with P19.
The instruction cycle is 4/fs or 8/fs by frequency double mask option in SLOW operation mode.
LCD display and high speed timer/counter with melody output are available for the SLOW operation mode.

P22 Initial value : 0000

3	2	1	0
*	SOM	*	*

SOM	Select operation mode
0	NORMAL operation mode
1	SLOW operation mode

P14 Initial value : *000

3	2	1	0
*	WKS	LFS	CPUS

LFS	Low-frequency status
0	LXIN source is not stable
1	LXIN source is stable

CPUS	CPU status
0	NORMAL operation mode
1	SLOW operation mode

WKS	Wakeup status
0	Wakeup not by internal timer
1	Wakeup by internal timer

Port14 is the status register for CPU. P14.0 (CPU status) and P14.1 (Low-frequency status) are read-only bits. p14.2 (wakeup status) will be set to "1" when CPU is wake-up by internal timer. P14.2 will be cleared to "0" when user out data to P14.

IDLE OPERATION MODE

The IDLE operation mode suspends all SLOW operations except for the low-frequency clock and LCD driver. It retains the internal status with low power consumption without stopping the clock function and LCD display.

LCD display is available for the IDLE operation mode. Sound generator is disabled in this mode. The IDLE operation mode will be wakeup and return to the SLOW operation mode by the internal timing generator or I/O pins (P0(0..3)/$\overline{\text{WAKEUP 0..3}}$ or P8(0..3)/$\overline{\text{WAKEUPA..D}}$).

Preliminary

P19 3 2 1 0 Initial value : 0000

IDME	SIDR

IDME	Enable IDLE mode
0 1	Enable IDLE mode
* *	Reserved

SIDR	Select IDLE releasing condition
0 0	P0(0..3), P8(0..3) pin input
0 1	P0(0..3), P8(0..3) pin input and 1 sec signal
1 0	P0(0..3), P8(0..3) pin input and 0.5 sec signal
1 1	P0(0..3), P8(0..3) pin input and 15.625 ms signal

STOP OPERATION MODE

The STOP operation mode suspends system operation and holds the internal status immediately before the suspension with low power consumption. This mode will be released by reset or I/O pins (P0(0..3)/$\overline{\text{WAKEUP 0..3}}$ or P8(0..3)/$\overline{\text{WAKEUP A..D}}$).

LCD display and high speed timer/counter with melody output are disabled in the mode.

P16 3 2 1 0 Initial value : 0000

SPME	SWWT

SPME	Enable STOP mode
0 1	Enable STOP mode
* *	Reserved

SWWT	Set wake-up warm-up time
0 0	wait normal frequency ready (2^6/fc)
0 1	wait slow frequency ready (2^{14}/fs)
1 0	wait slow frequency ready (2^7/fs)
1 1	Reserved

TIME BASE INTERRUPT (TBI)

The time base can be used to generate a fixed frequency interrupt. There are 8 kinds of frequencies can be selected by setting P25.

P25 3 2 1 0

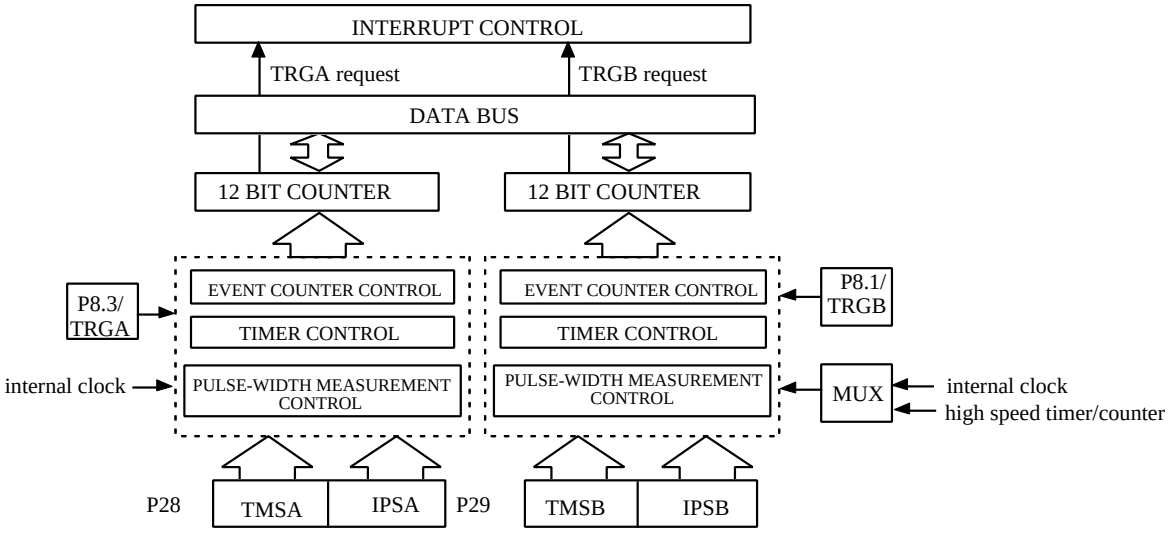
TIMER / COUNTER (TIMERA, TIMERB)

Timer/counters can support user three special functions:
1. Even counter
2. Timer.
3. Pulse-width measurement.

These three functions can be executed by 2 timer/counter independently.
For timerA, the counter data is saved in timer register TAH, TAM, TAL, which user can set counter initial value and read the counter value by instruction "LDATAH(M,L), STATAH(M,L)" and timer register is TBH, TBM, TBL and W/R instruction "LDATBH (M,L), STATBH (M,L)".

The basic structure of timer/counter is composed by two same structure counter, these two counters can be set initial value and send counter value to timer register, P28 and P29 are the command ports for timerA and timer B, user can choose different operation mode and different internal clock rate by setting these two ports. When timer/counter overflow, it will generate a TRGA(B) interrupt request to interrupt control unit.



TIMER/COUNTER CONTROL

P8.1/TRGB, P8.3/TRGA are the external timer inputs for timerB and timerA, they are used in event counter and pulse-width measurement mode.

Timer/counter command port: P28 is the command port for timer/counterA and P29 is for the timer/counterB.

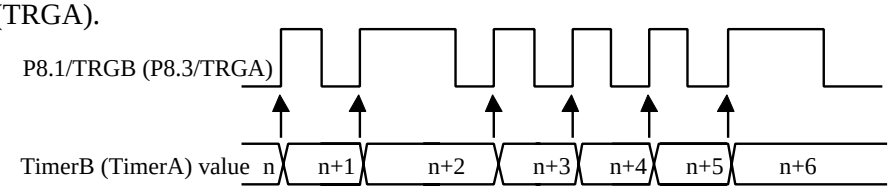
Preliminary

TIMER/COUNTER FUNCTION

Timer/counterA can be programmable for timer, event counter and pulse width measurement. Each timer/counter can execute any one of these functions independly.

EVENT COUNTER MODE

For event counter mode, timer/counter increases one at any rising edge of P8.1/TRGB for timerB (P8.3/TRGA for timer A). When timerB (timerA) counts overflow, it will give interrupt control an interrupt request TRGB (TRGA).

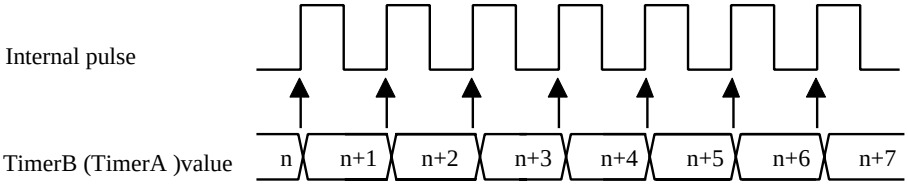


PROGRAM EXAMPLE: Enable timerA with P28

```
LDIA #0100B;
OUTA P28; Enable timerA with event counter mode
```

TIMER MODE

For timer mode, timer/counter increase one at any rising edge of internal pulse. User can choose 4 kinds of internal pulse rate by setting IPSB for timerB (IPSA for timerA).
When timer/counter counts overflow, TRGB (TRGA) will be generated to interrupt control unit.



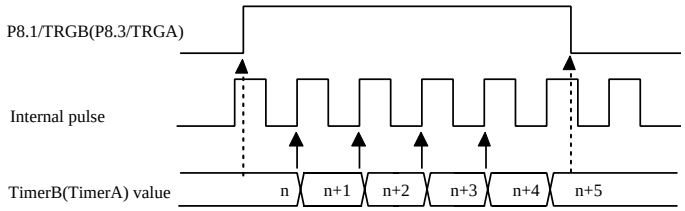
PROGRAM EXAMPLE: To generate TRGA interrupt request after 60 ms with system clock LXIN=32KHz

```
LDIA #0100B;
EXAE;    enable mask 2
EICIL 110111B; interrupt latch ←0, enable EI
LDIA #0AH;
STATAL;
LDIA #00H;
STATAM;
LDIA #0FH;
STATAH;
LDIA #1000B;
OUTA P28; enable timerA with internal pulse rate: LXIN/2^3 Hz
```

NOTE: The preset value of timer/counter register is calculated as following procedure.
Internal pulse rate: $LXIN/2^3$; LXIN = 32KHz
The time of timer counter count one = 2^3 /LXIN = 8/32768=0.244ms
The number of internal pulse to get timer overflow = 60 ms/ 0.244ms = 245.901= 0F6H
The preset value of timer/counter register = 1000H - 0F6H = 0F0AH

PULSE WIDTH MEASUREMENT MODE

For the pulse width measurement mode, the counter only incresed by the rising edge of internal pulse rate as external timer/counter input (P8.1/TRGB, P8.3/TRGA), interrupt request will be generated as soon as timer/counter count overflow.

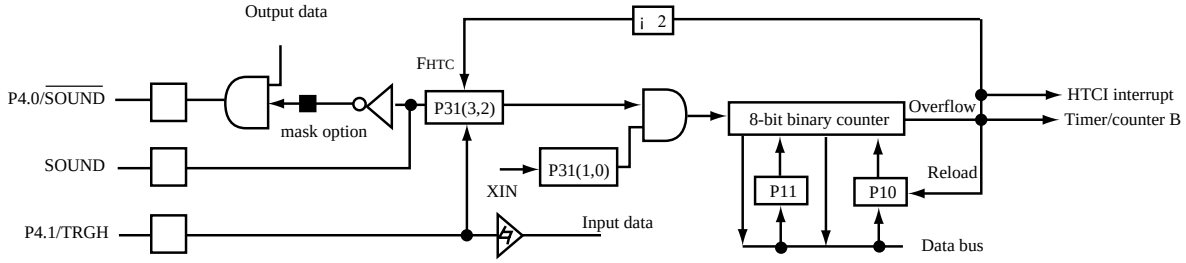


PROGRAM EXAMPLE: Enable timerA by pulse width measurement mode.
LDIA #1100b;
OUTA P28; Enable timerA with pulse width measurement mode.

HIGH SPEED TIMER/COUNTER

EM73461B has one 8-bit high speed timer/counter (HTC). It supports three special functions : auto load timer, melody output and pulse width measurement modes. The HTC is available for the NORMAL and SLOW operation mode.

The HTC can be set initial value and send counter value to counter registers (P11 and P10), P31 is the command port for HTC, user can choose different operation mode and different internal clockrate by setting the port. The timer/counter increase one at the rising edge of internal pulse. The HTC can generate an overflow interrupt (HTCI) when it overflows. The HTCI cannot be generated when the HTC is in the melody mode or disabled.



P31 is the command register of the 8-bit high speed timer/counter.

P31 | 3 | 2 | 1 | 0 | Initial value : 0000
HTMS HIPS

* : only for 9.2MHz

HTMS	Mode selection
0 0	Stop
0 1	Auto load timer mode
1 0	Melody mode
1 1	Pulse width measurement mode

HIPS	Clock rate selection	
	NORMAL mode	SLOW mode
0 0	LXIN/2^0 Hz	LXIN/2^0 Hz
0 1	LXIN/2^2 Hz	LXIN/2^2 Hz
1 0	fc/2^4 or fc/2^5 *	Reserved
1 1	fc/2^6 or fc/2^8 *	Reserved

P11 and P10 are the counter registers of the 8-bit high speed timer/counter. P10 is the lower nibble register and P11 is the higher nibble register. (HT is the value of counter registers.)

P11 3 2 1 0 Higher nibble register P10 3 2 1 0 Lower nibble register Initial value : 0000 0000 (HT)

Preliminary

** F_{HTC}=[(XIN/2^X)/(100H-HT)]/2, HT=0~255
** Example : LXIN=32K Hz, HIPS=01, HT=11110000B=0F0H.
⇒F_{HTC}=[(32K Hz/2^2)/(100H-0f0H)]/2=256 Hz.

```
LDIA    #1111B
OUTA    P11
LDIA    #0000B
OUTA    P10
LDIA    #1001B
OUTA    P31
```

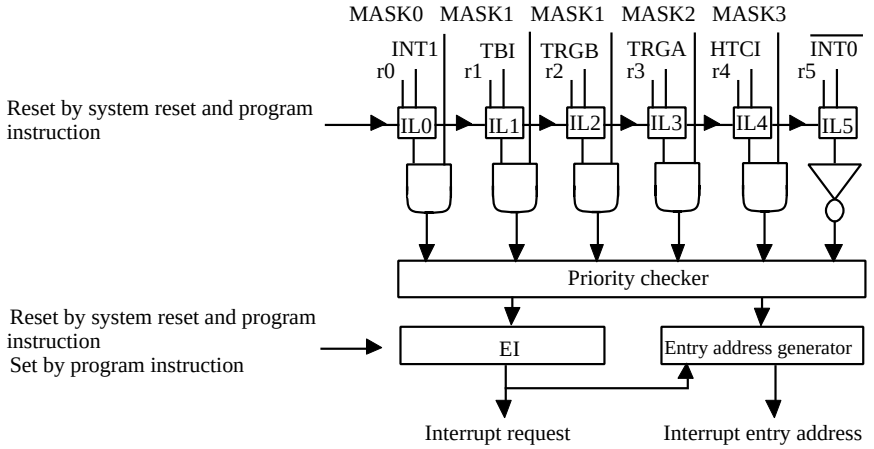
The value of 8-bit binary up counter can be presetted by P10 and P11. The value of registers can loaded into the HTC when the counter starts counting or occurs overflow. If user write value to the registers before the next overflow occurs, the preset value can be changed.
The preset value will be changed when users output the different data to P10 and P11.
The count value of HTC can be read from P10 and P11. The value is unstable when user read the value during counting. Thus, user must disable the counter before reading the value.
The P4.0/SOUND and SOUND pins will output the squre wave in the melody mode. When the CPU is not in the melody mode, the P4.0/SOUND is high and SOUND is low.
The P4.1/RGH pin will be the input pin in the pulse width measurement mode. User must output high to P4.1/TRGH and then it can be the HTC external input pin. When the HTC is disabled, the P4.1 pin is a normal I/O pin.

INTERRUPT FUNCTION

There are 6 interrupt sources, 2 external interrupt sources, 4 internal interrupt sources. Multiple interrupts are admitted according the priority.

Type	Interrupt source	Priority	Interrupt Latch	Interrupt Enable condition	Program ROM entry address
External	Externalinterrupt($\overline{INT0}$)	1	IL5	EI=1	002H
Internal	High speed timer overflow interrupt (HTCI)	2	IL4	EI=1,MASK3=1	004H
Internal	TimerA overflow interrupt (TRGA)	3	IL3	EI=1,MASK2=1	006H
Internal	TimerB overflow interrupt (TRGB)	4	IL2	EI=1,MASK1=1	008H
Internal	Time base interrupt(TBI)	5	IL1		00AH
External	Externalinterrupt($\overline{INT1}$)	6	IL0	EI=1,MASK0=1	00CH

INTERRUPT STRUCTURE



Preliminary

Interrupt controller:

IL0-IL5 : Interrupt latch. Hold all interrupt requests from all interrupt sources. ILr can not be set by program, but can be reset by program or system reset, so IL only can decide which interrupt source can be accepted.

MASK0-MASK3 : Except $\overline{INT0}$, MASK register can promit or inhibit all interrupt sources.

EI : Enable interrupt Flip-Flop can promit or inhibit all interrupt sources, when interrupt happened, EI is cleared to "0" automatically, after RTI instruction happened, EI will be set to "1" again.

Priority checker : Check interrupt priority when multiple interrupts happened.

INTERRUPT FUNCTION

The procedure of interrupt operation:
1. Push PC and all flags to stack.
2. Set interrupt entry address into PC.
3. Set SF= 1.
4. Clear EI to inhibit other interrupts happened.
5. Clear the IL for which interrupt source has already be accepted.
6. To excute interrupt subroutine from the interrupt entry address.
7. CPU accept RTI, restore PC and flags from stack. Set EI to accept other interrupt requests.

PROGRAM EXAMPLE: To enable interrupt of "INT0, TRGA"

```
LDIA #1100B;
EXAE; set mask register "1100B"
EICIL 111111B ; enable interrupt F.F.
```

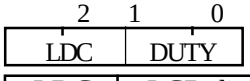
LCD DRIVER

EM73461B can directly drive the liquid crystal display (LCD) and has 32 segment, 4 common output pins (1/2 bias, 1/3 bias). There are total 32x4 dots can be display. The V1, V2, V3, VA, VB, VDD and VSS pins are the LCD bias generator.

CONTROL OF LCD DRIVER

The LCD driver control command register is P27. When LDC is 0, the LCD is disabled, the COM and SEG pins are VSS. When LDC is 1, the LCD driver enables.
When the CPU is reseted or during the STOP operation mode, the LCD driver is disabled.

Port27 Initial value : 0000



LDC	LCD display control
0	LCD display disable
1	LCD display enable

DUTY	Driving method select
0 0 0	1/4 duty (1/3 bias)
0 0 1	1/4 duty (1/2 bias)
0 1 0	1/3 duty (1/3 bias)
0 1 1	1/3 duty (1/2 bias)
1 0 0	1/2 duty (1/2 bias)
1 0 1	Static
1 1 *	Reserved

The LCD display data is stored in the display data area of the data memory (RAM).
The display data area begins with address 20H during reset. The LCD display data area ia as below :

Preliminary

	RAM address	COM3 bit3	COM2 bit2	COM1 bit1	COM0 bit0
SEG0	20H				
SEG1	21H				
SEG2	22H				
:	:				
:	:				
SEG30	3EH				
SEG31	3FH				

The relation between LCD display data and driving method

Driving method	bit3	bit2	bit1	bit0
1/4 duty	COM3	COM2	COM1	COM0
1/3 duty	-	COM2	COM1	COM0
1/2 duty	-	-	COM1	COM0
Static	-	-	-	COM0

LCD frame frequency : According to the drive method to set the frame frequency.

Duty	Frame frequency (Hz)
1/4 duty	64 x (4/4) = 64
1/3 duty	64 x (4/3) = 85
1/2 duty	64 x (4/2) = 128
Static	64

PROGRAM EXAMPLE :

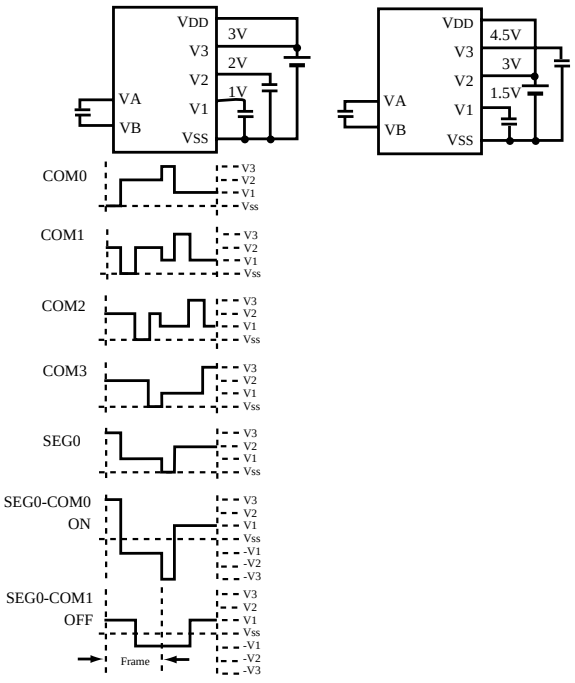
```
LDIA    #0001B      ; 1/4 duty, 1/2 bias
OUTA    P27
LDIA    #1001B      ; enable LCD
OUTA    P27
```

LCD DRIVING METHODS

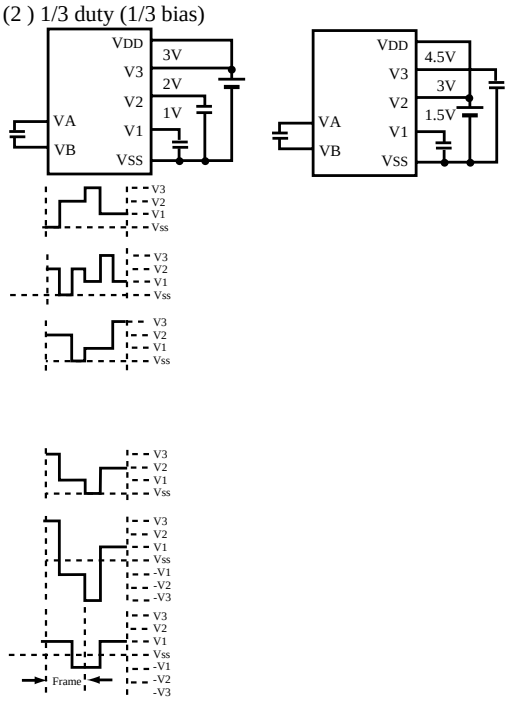
There are six kinds of driving methods can be selected by DUTY (P27.0~P27.2). The drivinf waveforms of LCD driver are as below :

- **VDD=3V**

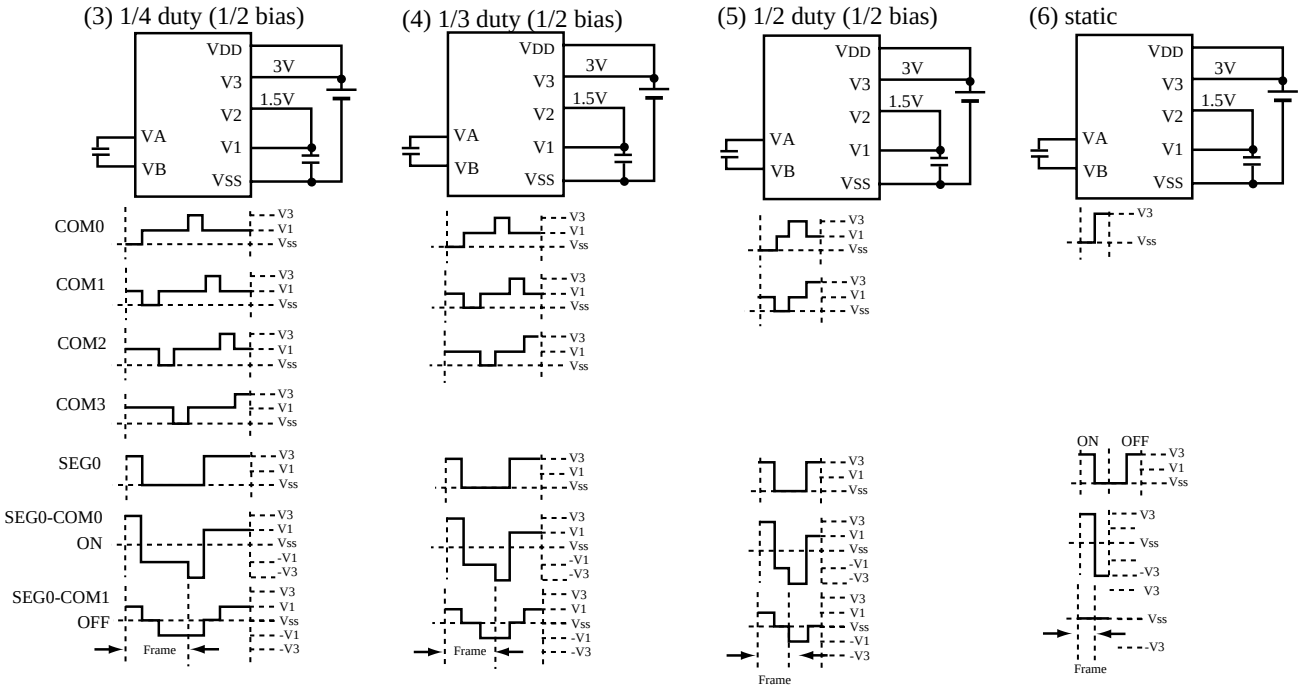
(1) 1/4 duty (1/3 bias)



(2) 1/3 duty (1/3 bias)

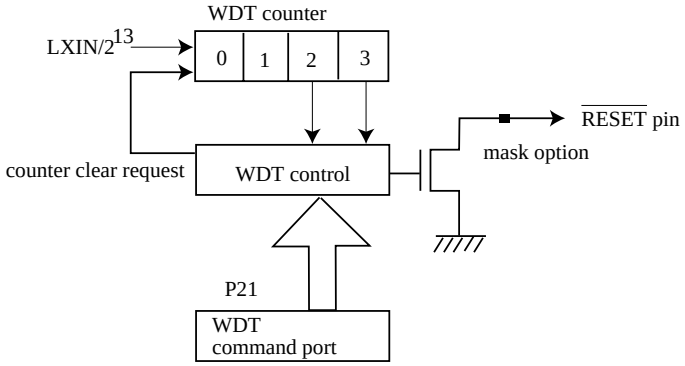


Preliminary



WATCH-DOG-TIMER (WDT)

Watch-dog-timer can help user to detect the malfunction (runaway) of CPU and give system a timeup signal every certain time . User can use the time up signal to give system a reset signal when system is fail.
This function is available by mask option. If the mask option of WDT is enabled, it will stop counting when CPU is reseted or in the STOP operation mode.
The basic structure of Watch-Dog-Timer control is composed by a 4-stage binary counter and a control unit. The WDT counter counts for a certain time to check the CPU status, if there is no malfunction happened, the counter will be cleared and continue counting. Otherwise, if there is a malfunction happened, the WDT control will send a WDT signal (low active) to reset CPU. The WDT checking period is assign by P21 (WDT command port).



Preliminary

P21 is the control port of watch-dog-timer, and the WDT time up signal is connected to $\overline{\text{RESET}}$.

Port 21 3 2 1 0 Initial value :0000

CWC	*	*	WDT

CWC	Clear watchdog timer counter
0	Clear counter then return to 1
1	Nothing

WDT	Set watch-dog-timer detect time
0	3 x 2^{13}/LXIN = 3 x 2^{13}/32K Hz = 0.75 sec
1	7 x 2^{13}/LXIN = 7 x 2^{13}/32K Hz = 1.75 sec

PROGRAM EXAMPLE

To enable WDT with 7 x 2^{13}/LXIN detection time.

```
LDIA#0001B
OUTA P21; set WDT detection time and clear WDT counter
:
:
```

RESETTING FUNCTION

When CPU in normal working condition and $\overline{\text{RESET}}$ pin holds in low level for three instruction cycles at least, then CPU begins to initialize the whole internal states, and when $\overline{\text{RESET}}$ pin changes to high level, CPU begins to work in normal condition.

The CPU internal state during reset condition is as following table :

Hardware condition in RESET state	Initial value
Program counter	0000h
Status flag	01h
Interrupt enable flip-flop (EI)	00h
MASK0 ,1, 2, 3	00h
Interrupt latch (IL)	00h
P10, 11,14, 16, 19, 25, 27, 28, 29, 31	00h
P4, 8, 23, 24	0Fh
Both oscillator	Start oscillation

The $\overline{\text{RESET}}$ pin is a hysteresis input pin and it has a pull-up resistor available by mask option.
The simplest RESET circuit is connect $\overline{\text{RESET}}$ pin with a capacitor to V_{SS} and a diode to V_{DD}.

**** SYMBOL DESCRIPTION

Symbol	Description	Symbol	Description
HR	H register	LR	L register
PC	Program counter	DP	Data pointer
SP	Stack pointer	STACK[SP]	Stack specified by SP
A_{CC}	Accumulator	FLAG	All flags
CF	Carry flag	ZF	Zero flag
SF	Status flag	GF	General flag @ just for 4K ROM
EI	Enable interrupt register	IL	Interrupt latch
MASK	Interrupt mask	PORT[p]	Port (address : p)
TA	Timer/counter A	TB	Timer/counter B
RAM[HL]	Data memory (address : HL)	RAM[x]	Data memory (address : x)
$ROM[DP]_L$	Low 4-bit of program memory	$ROM[DP]_H$	High 4-bit of program memory
$[DP]_L$	Low 4-bit of data pointer register	$[DP]_M$	Middle 4-bit of data pointer register
$[DP]_H$	High 4-bit of data pointer register	$[TA]_L([TB]_L)$	Low 4-bit of timer/counter A (timer/counter B) register
$[TA]_M([TB]_M)$	Middle 4-bit of timer/counter A (timer/counter B) register	$[TA]_H([TB]_H)$	High 4-bit of timer/counter A (timer/counter B) register
←	Transfer	↔	Exchange
+	Addition	-	Substraction
&	Logic AND	¦	Logic OR
^	Logic XOR	'	Inverse operation
.	Concatenation	#k	4-bit immediate data
x	8-bit RAM address	y	4-bit zero-page address
p	4-bit or 5-bit port address	b	Bit address
r	6-bit interrupt latch	PC_{11-6}	Bit 11 to 6 of program counter
LR_{1-0}	Contents of bit assigned by bit 1 to 0 of LR	a_{5-0}	Bit 5 to 0 of destination address for branch instruction
LR_{3-2}	Bit 3 to 2 of LR
