## FAIRCHILD

SEMICONDUCTOR

### 100325 Low Power Hex ECL-to-TTL Translator

#### **General Description**

The 100325 is a hex translator for converting F100K logic levels to TTL logic levels. Differential inputs allow each circuit to be used as an inverting, non-inverting or differential receiver. An internal reference voltage generator provides  $V_{BB}$  for single-ended operation, or for use in Schmitt trigger applications. All inputs have  $50 \mathrm{k}\Omega$  pull-down resistors. When the inputs are either unconnected or at the same potential the outputs will go LOW.

When used in single-ended operation the apparent input threshold of the true inputs is 20mV to 40mV higher (positive) than the threshold of the complementary inputs. The  $V_{\text{EE}}$  and  $V_{\text{TTL}}$  power may be applied in either order.

#### Features

- Pin/function compatible with 100125
- Meets 100125 AC specifications
- 50% power reduction of the 100125
- Differential inputs with built in offset
- Standard FAST® outputs
- 2000V ESD protection
- –4.2V to –5.7V operating range
- Available to industrial grade temperature range

July 1988

Revised August 2000

## +150°C -7.0V to +0.5V -0.5V to +6.0V $V_{\mbox{\scriptsize EE}}$ to +0.5V

### **Recommended Operating** -65°C to +150°C Conditions

| Case Temperature (T <sub>C</sub> ) |                |
|------------------------------------|----------------|
| Commercial                         | 0°C to +85°C   |
| Industrial                         | -40°C to +85°C |
| Supply Voltage (V <sub>EE</sub> )  | -5.7V to -4.2V |
|                                    |                |

-0.5V to  $V_{CC}$   $\,$  Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical the rated I<sub>OL</sub> (mA) Characteristics tables are not guaranteed at the absolute maximum rating. The "Recommended Devices" a sub-≥2000V The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: ESD testing conforms to MIL-STD-883, Method 3015.

| IIH               | Input HIGH Current                    |                       |       | 350                   | μA    | $\label{eq:VIN} \begin{array}{c} V_{IN} = V_{IH\ (Max)},\ D_0 \mathchar`- D_5 = V_{BB},\\ \hline D_0 \mathchar`- D_5 = V_{IL\ (Min)} \end{array}$ |   |  |
| IIL               | Input LOW Current                     | 0.5                   |       |                       | μA    | $V_{IN} = V_{IL (Min)}, D_0 - D_5 = V_{BB}$   |   |  |
| I <sub>OS</sub>   | Output Short-Circuit Current          | -150                  |       | -60                   | mA    | V <sub>OUT</sub> = GND (Note 4)   |   |  |
| I <sub>EE</sub>   | VEE Power Supply Current              | -37                   | -27   | -17                   | mA    | $D_0 - D_5 = V_{BB}$  |   |  |
| ITTL              | V <sub>TTL</sub> Power Supply Current | 1                     | 45    | 65                    | mA    | $D_0 - D_5 = V_{BB}$  |   |  |

Note 3: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

Note 4: Test one output at a time.

Note 5: Output-to-Output Skew is defined as the absolute value of the difference between the actual propagation delay for any outputs within the same packaged device. The specifications apply to any outputs switching in the same direction either HIGH-to-LOW (t<sub>OSHL</sub>), or LOW-to-HIGH (t<sub>OSLH</sub>), or in opposite directions both HL and LH (t<sub>OST</sub>). Parameters t<sub>OST</sub> and t<sub>PS</sub> guaranteed by design.

Note 6: The specified limits represent the "worst case" value for the parameter. Since these values normally occur at the temperature extremes, additional noise immunity and guardbanding can be achieved by decreasing the allowable system operating ranges. Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.

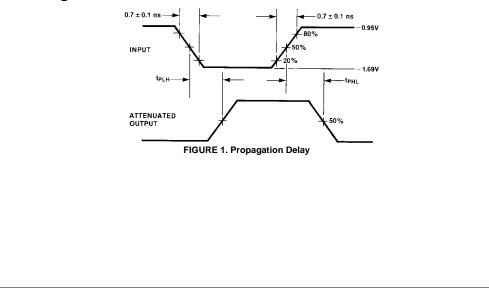

Note 7: Test one output at a time.
