

March 1990 Revised December 1998

### **74ACTQ843**

# **Quiet Series™ 9-Bit Transparent Latch** with 3-STATE Outputs

### **General Description**

The ACTQ843 bus interface latch is designed to eliminate the extra packages required to buffer existing latches and provide extra data width for wider address/data paths. The ACTQ843 utilizes Fairchild FACT Quiet Series™ technology to guarantee quiet output switching and improved dynamic threshold performance. FACT Quiet Series features GTO™ output control and undershoot corrector in addition to a split ground bus for superior performance.

### **Features**

- Guaranteed simultaneous switching noise level and dynamic threshold performance
- Guaranteed pin-to-pin skew AC performance
- Inputs and outputs on opposite sides of package for easy interface with microprocessors
- Improved latch-up immunity
- Outputs source/sink 24 mA
- ACTQ843 has TTL-compatible inputs
- Functionally and pin-compatible to AMD's AM29843
- 3-STATE outputs for bus interfacing

## **Ordering Code:**

Order Number	Package Number	Package Description
74ACTQ843SC	M24B	24-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-013, 0.300" Wide Body
74ACTQ843SPC	N24C	24-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-100, 0.300" Wide

Device also available in Tape and Reel. Specify by appending suffix letter "X" to the ordering code

## **Functional Description**

The ACTQ843 consists of nine D-type latches with 3-STATE outputs. The flip-flops appear transparent to the data when Latch Enable (LE) is HIGH. This allows asynchronous operation, as the output transition follows the data in transition. On the LE HIGH-to-LOW transition, the data that meets the setup times is latched. Data appears on the bus when the Output Enable  $(\overline{OE})$  is LOW. When  $\overline{OE}$  is HIGH, the bus output is in the high impedance state. In addition to the LE and  $\overline{\text{OE}}$  pins, the ACTQ843 has a Clear ( $\overline{\text{CLR}}$ ) pin and a Preset ( $\overline{\text{PRE}}$ ) pin. These pins are ideal for parity bus interfacing in high performance systems. When  $\overline{\text{CLR}}$  is LOW, the outputs are LOW if  $\overline{\text{OE}}$  is LOW. When  $\overline{\text{CLR}}$  is HIGH, data can be entered into the latch. When  $\overline{\text{PRE}}$  is LOW, the outputs are HIGH if  $\overline{\text{OE}}$  is LOW. Preset overrides  $\overline{\text{CLR}}$ .

### **Function Table**

		Inputs			Internal	Outputs	Function

## **Logic Diagram**

### **Absolute Maximum Ratings**(Note 1)

Supply Voltage ( $V_{CC}$ ) -0.5V to +7.0V

DC Input Diode Current (I<sub>IK</sub>)

 $\begin{array}{ccc} V_{I} = -0.5 V & -20 \text{ mA} \\ V_{I} = V_{CC} + 0.5 V & +20 \text{ mA} \\ \\ DC \text{ Input Voltage (V_{I})} & -0.5 V \text{ to } V_{CC} + 0.5 V \\ \end{array}$ 

DC Output Diode Current (I OK)

 $\begin{aligned} & \text{V}_{\text{O}} = -0.5 \text{V} & -20 \text{ mA} \\ & \text{V}_{\text{O}} = \text{V}_{\text{CC}} + 0.5 \text{V} & +20 \text{ mA} \\ & \text{DC Output Voltage (V}_{\text{O}}) & -0.5 \text{V to V}_{\text{CC}} + 0.5 \text{V} \end{aligned}$ 

DC Output Source

or Sink Current (I<sub>O</sub>) ±50 mA

DC  $V_{CC}$  or Ground Current

per Output Pin ( $I_{\rm CC}$  or  $I_{\rm GND}$ )  $\pm 50$  mA Storage Temperature ( $T_{\rm STG}$ )  $-65^{\circ}{\rm C}$  to  $+150^{\circ}{\rm C}$ 

DC Latch-Up Source

or Sink Current  $\pm$  300 mA

Junction Temperature ( $T_J$ ) PDIP 140°C

## Recommended Operating Conditions

 $V_{\mbox{\footnotesize{IN}}}$  from 0.8V to 2.0V

V<sub>CC</sub> @ 4.5V, 5.5V

Note 1: Absolute maximum ratings are those values beyond which damage to the device may occur. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation of FACT™ circuits outside databook specifications.

### **FACT Noise Characteristics**

The setup of a noise characteristics measurement is critical to the accuracy and repeatability of the tests. The following is a brief description of the setup used to measure the noise characteristics of FACT.

### Equipment:

Hewlett Packard Model 8180A Word Generator PC-163A Test Fixture

Tektronics Model 7854 Oscilloscope

#### Procedure:

- 1. Verify Test Fixture Loading: Standard Load 50 pF,  $500\Omega$ .
- 2. Deskew the HFS generator so that no two channels have greater than 150 ps skew between them. This requires that the oscilloscope be deskewed first. It is important to deskew the HFS generator channels before testing. This will ensure that the outputs switch simultaneously.
- Terminate all inputs and outputs to ensure proper loading of the outputs and that the input levels are at the correct voltage.
- 4. Set the HFS generator to toggle all but one output at a frequency of 1 MHz. Greater frequencies will increase DUT heating and effect the results of the measurement.
- Set the HFS generator input levels at 0V LOW and 3V HIGH for ACT devices and 0V LOW and 5V HIGH for AC devices. Verify levels with an oscilloscope.

Note 10: V<sub>OHV</sub> and V<sub>OLP</sub> are measured with respect to ground reference. Note 11: Input pulses have the following characteristics: f = 1 MHz,  $t_r = 3 \text{ ns}, t_f = 3 \text{ ns}, \text{ skew} < 150 \text{ ps}.$ 

 $\rm V_{OLP}/\rm V_{OLV}$  and  $\rm V_{OHP}/\rm V_{OHV}$ :

- · Determine the quiet output pin that demonstrates the greatest noise levels. The worst case pin will usually be the furthest from the around pin. Monitor the output voltages using a  $50\Omega$  coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- Measure  $V_{\mbox{\scriptsize OLP}}$  and  $V_{\mbox{\scriptsize OLV}}$  on the quiet output during the worst case transition for active and enable. Measure V<sub>OHP</sub> and V<sub>OHV</sub> on the quiet output during the worst case active and enable transition.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.

### $V_{\text{ILD}}$ and $V_{\text{IHD}}$ :

- Monitor one of the switching outputs using a  $50\Omega$  coaxial cable plugged into a standard SMB type connector on the test fixture. Do not use an active FET probe.
- First increase the input LOW voltage level,  $\mathbf{V}_{\mathrm{IL}},$  until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds  $V_{\text{IL}}$  limits, or on output HIGH levels that exceed VIH limits. The input LOW voltage level at which oscillation occurs is defined as  $V_{\text{ILD}}$ .
- Next decrease the input HIGH voltage level on the,  $V_{\rm IH}$ , until the output begins to oscillate or steps out a min of 2 ns. Oscillation is defined as noise on the output LOW level that exceeds  $V_{\text{IL}}$  limits, or on output  $\dot{\text{HIGH}}$  levels that exceed  $V_{\mbox{\scriptsize IH}}$  limits. The input HIGH voltage level at which oscillation occurs is defined as VIHD.
- Verify that the GND reference recorded on the oscilloscope has not drifted to ensure the accuracy and repeatability of the measurements.
