74LCX241 Low Voltage Octal Buffer/Line Driver with **5V Tolerant Inputs and Outputs**

General Description

The LCX241 is an octal buffer and line driver designed to be employed as a memory address driver, clock driver and bus oriented transmitter or receiver. The device is designed for low voltage (2.5V or 3.3V) $V_{\mbox{CC}}$ applications with capability of interfacing to a 5V signal environment.

The LCX241 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining CMOS low power dissipation.

Features

- 5V tolerant inputs and outputs
- 2.3V 3.6V V_{CC} specifications provided
- \blacksquare 6.5 ns t_{PD} max (V_{CC} = 3.3V), 10 μA I_{CC} max
- Power-down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- Implements patented noise/EMI reduction circuitry
- Latch-up performance exceeds 500 mA
- ESD performance:
 - Human Body Model > 2000V
 - Machine Model > 200V

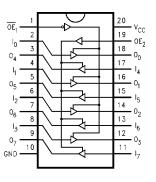

Note 1: To ensure the high-impedance state during power up or down, $\overline{\text{OE}}$ should be tied to V_{CC} and OE should be tied to GND through a resistor: the minimum value or the resistor is determined by the current-sourcing capa-bility of the driver.

Note 6: Skew is defined as the absolute value of the difference between the actual propagation delay for any two separate outputs of the same device. The specification applies to any outputs switching in the same direction, either HIGH-to-LOW (t_{OSHL}) or LOW-to-HIGH (t_{OSLH}).
