#### 74LVX574 Low Voltage Octal D-Type Flip-Flop with 3-STATE Outputs

#### **General Description**

The LVX574 is a high-speed octal D-type flip-flop which is controlled by an edge-triggered clock input (CP) and a buffered common Output Enable ( $\overline{OE}$ ) input. When the  $\overline{OE}$  input is HIGH, the eight outputs are in a high impedance state. The LVX574 is functionally identical to the LVX374 but with inputs and outputs on opposite sides of the package. The inputs tolerate up to 7V allowing interface of 5V systems to 3V systems.

#### Features

- Input voltage translation from 5V to 3V
- Ideal for low power/low noise 3.3V applications
- Guaranteed simultaneous switching noise level and dynamic threshold performance

The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: Unused inputs must be held HIGH or LOW. They may not float.

 Capacitance (Note 5)

 Note 5: C<sub>PD</sub> is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation:  $I_{CC(opr.)} = \frac{C_{PD} \times V_{CC} \times f_{IN} + I_{CC}}{8 \text{ (per latch)}}$
