## 74VCX162827

### Low Voltage 20-Bit Buffer/Line Driver with 3.6V Tolerant Inputs and Outputs and 26Ω Series Resistors in the Outputs

#### General Description

The VCX162827 contains twenty non-inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver. The device is byte controlled. Each byte has NOR output enables for maximum control flexibility.

The 74VCX162827 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O capability up to 3.6V. The VCX162827 is also designed with 26Ω resistors in the outputs.

The 74VCX162827 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

**Functional Description**

The 74VCX162827 contains twenty non-inverting buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of each other. The control pins may be shorted together to obtain full 20-bit operation. The 3-STATE outputs are controlled by Output Enable ( $\overline{OE}_n$ ) inputs. When  $\overline{OE}_1$ , and  $\overline{OE}_2$  are LOW,  $O_0 - O_{10}$  are in the 2-state mode. When either  $\overline{OE}_1$  or  $\overline{OE}_2$  are HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs. The same applies for byte two with  $\overline{OE}_3$  and  $\overline{OE}_4$ .
