# Low Voltage 20-Bit D-Type Flip-Flops with 3.6V Tolerant Inputs and Outputs

### General Description

The VCX16721 contains twenty non-inverting D-type flip-flops with 3-STATE outputs and is intended for bus oriented applications.

The 74VCX16721 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O compatibility up to 3.6V.

The 74VCX16721 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

**Functional Description**

The VCX16721 contains twenty D-type flip-flops with 3-STATE standard outputs. The twenty flip-flops will store the state of their individual D-type inputs that meet the setup and hold time requirements on the LOW-HIGH Clock (CLK) transition, when the Clock-Enable ( $\overline{CE}$ ) is LOW. The 3-STATE standard outputs are controlled by the Output-Enable ( $OE$ ). When  $OE$  is HIGH, the standard outputs are in high impedance mode but this does not interfere with entering new data into the flip-flops.
