# Low Voltage 20-Bit Buffer/Line Driver with 3.6V Tolerant Inputs and Outputs

### General Description

The VCX16827 contains twenty non-inverting buffers with 3-STATE outputs to be employed as a memory and address driver, clock driver, or bus oriented transmitter/receiver carrying parity. The device is byte controlled. Each byte has NOR output enables for maximum control flexibility.

The 74VCX16827 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O capability up to 3.6V.

The 74VCX16827 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

### Functional Description

The 74VCX16827 contains twenty non-inverting buffers with 3-STATE outputs. The device is byte controlled with each byte functioning identically, but independent of each other. The control pins may be shorted together to obtain full 16-bit operation. The 3-STATE outputs are controlled by Output Enable ( $\overline{OE}_n$ ) inputs. When  $\overline{OE}_1$ , and  $\overline{OE}_2$  are LOW,  $O_0-O_{10}$  are in the 2-state mode. When either  $\overline{OE}_1$  or  $\overline{OE}_2$  are HIGH, the standard outputs are in the high impedance mode but this does not interfere with entering new data into the inputs. The same applies for byte two with  $\overline{OE}_3$  and  $\overline{OE}_4$ .
