## 74VCX16835 Low Voltage 18-Bit Universal Bus Driver with 3.6V Tolerant Inputs and Outputs

#### **General Description**

The VCX16835 low voltage 18-bit universal bus driver combines D-type latches and D-type flip-flops to allow data flow in transparent, latched and clocked modes.

Data flow is controlled by output-enable  $(\overline{OE})$ , latch-enable (LE), and clock (CLK) inputs. The device operates in Transparent Mode when LE is held HIGH. The device operates in clocked mode when LE is LOW and CLK is toggled. Data transfers from the Inputs (I<sub>n</sub>) to Ouputs (O<sub>n</sub>) on a Positive Edge Transition of the Clock. When  $\overline{OE}$  is LOW, the output data is enabled. When  $\overline{OE}$  is HIGH the output port is in a high impedance state.

The 74VCX16835 is designed for low voltage (1.65V to 3.6V)  $V_{CC}$  applications with I/O capability up to 3.6V.

The 74VCX16835 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

#### Features

- Compatible with PC100 DIMM module specifications
- 1.65V–3.6V V<sub>CC</sub> specifications provided
- 3.6V tolerant inputs and outputs
- t<sub>PD</sub> (CP to O<sub>n</sub>) 4.2ns max for 3.0V to 3.6V V<sub>CC</sub> 5.2ns max for 2.3V to 2.7V V<sub>CC</sub> 9.2ns max for 1.65V to 1.95V V<sub>CC</sub>
- Power-down high impedance inputs and outputs
- Supports live insertion/withdrawal (Note 1)
- Static Drive (I<sub>OL</sub>/I<sub>OL</sub>) ±24mA @ 3.0V
- ±18mA @ 2.3V ±6mA @ 1.65V ■ Latchup performance exceeds 300 mA
- ESD performance:
  - Human body model > 2000V
    - Machine model >200V

Note 1: To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  (OE to GND) through a pulldown resistor; the minimum value of the resistor is determined by the current sourcing capability of the driver.

Note 4: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the Absolute Maximum Ratings. The Recommended Operating Conditions tables will define the conditions for actual device operation.

Note 5:  $\mathrm{I}_{\mathrm{O}}$  Absolute Maximum Rating must be observed.

Note 6: Floating or unused pin (inputs or I/O's) must be held HIGH or LOW.
