

74VCXH16374 Low Voltage 16-Bit D-Type Flip-Flop with Bushold

General Description

The VCXH16374 contains sixteen non-inverting D-type flip-flops with 3-STATE outputs and is intended for bus oriented applications. The device is byte controlled. A buffered clock (CP) and output enable (\overline{OE}) are common to each byte and can be shorted together for full 16-bit operation.

The VCXH16374 data inputs include active bushold circuitry, eliminating the need for external pull-up resistors to hold unused or floating data inputs at a valid logic level.

The 74VCXH16374 is designed for low voltage (1.65V to 3.6V) V_{CC} applications with output compatibility up to 3.6V.

The 74VCXH16374 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

Features

- 1.65V–3.6V V_{CC} supply operation
- 3.6V tolerant control inputs and outputs
- Bushold on data inputs eliminates the need for external pull-up/pull-down resistors
- t_{PD}
 - 3.0 ns max for 3.0V to 3.6V V_{CC}
 - 3.9 ns max for 2.3V to 2.7V V_{CC}
 - 7.8 ns max for 1.65V to 1.95V V_{CC}
- Static Drive (I_{OH}/I_{OL})
 - ±24 mA @ 3.0V V_{CC}
 - ±18 mA @ 2.3V V_{CC}
 - ±6 mA @ 1.65V V_{CC}
- Uses patented noise/EMI reduction circuitry
- Latch-up performance exceeds 300 mA
- ESD performance:
 - Human body model > 2000V
 - Machine model > 200V

Functional Description

The 74VCXH16374 consists of sixteen edge-triggered flip-flops with individual D-type inputs and 3-STATE true outputs. The device is byte controlled with each byte functioning identically, but independent of the other. The control pins can be shorted together to obtain full 16-bit operation. Each clock has a buffered clock and buffered Output Enable common to all flip-flops within that byte. The description which follows applies to each byte. Each flip-

flop will store the state of their individual I inputs that meet the setup and hold time requirements on the LOW-to-HIGH Clock (CP_n) transition. With the Output Enable (\overline{OE}_n) LOW, the contents of the flip-flops are available at the outputs. When \overline{OE}_n is HIGH, the outputs go to the high impedance state. Operations of the \overline{OE}_n input does not affect the state of the flip-flops.
