# 74VHC02 Quad 2-Input NOR Gate

#### **General Description**

The VHC02 is an advanced high-speed CMOS 2-Input NOR Gate fabricated with silicon gate CMOS technology. It achieves the high-speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation. The internal circuit is composed of 3 stages, including buffer output, which provide high noise immunity and stable output. An input protection circuit insures that 0V to 7V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such

as battery backup. This circuit prevents device destruction due to mismatched supply and input voltages.

#### **Features**

- High Speed:  $t_{PD} = 3.6 \text{ ns (typ)}$  at  $V_{CC} = 5V$
- $\blacksquare$  Low power dissipation:  $I_{CC}=2~\mu\text{A}$  (max) at  $T_{A}=25^{\circ}\text{C}$
- High noise immunity: V<sub>NIH</sub> = V<sub>NIL</sub> = 28% V<sub>CC</sub> (min)
- Power down protection is provided on all inputs
- Low noise: V<sub>OLP</sub> = 0.8V (max)
- Pin and function compatible with 74HC02

Note 1: Absolute Maximum Ratings are values beyond which the device may be damaged or have its useful life impaired. The databook specifications should be met, without exception, to ensure that the system design is reliable over its power supply, temperature, and output/input loading variables. Fairchild does not recommend operation outside databook specifica-

Note 2: Unused inputs must be held HIGH or LOW. They may not float.
