DM74ALS125 Quad 3-STATE Buffer

General Description

This device contains four independent gates each of which performs a non-inverting buffer function. The outputs have the 3-STATE feature. The 3-STATE circuitry contains a feature that maintains the buffer outputs in 3-STATE (high impedance state) during power supply ramp-up or rampdown. This eliminates bus glitching problems that arise during power-up and power-down. To minimize the possibility that two outputs will attempt to take a common bus to opposite logic levels, the disable time is shorter than the enable time of the outputs.

Features

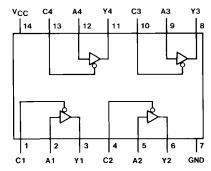

- Advanced low power oxide-isolated ion-implanted
- Functional and pin compatible with the 74LS counterpart
- Switching response specified into 500 Ω and 50 pF load
- temperature and $V_{\mbox{\footnotesize CC}}$ supply range
- PNP input design reduces input loading
- Low level drive current: 74ALS = 24 mA

Ordering Code:

Order Number	Package Number	Package Description				
DM74ALS125M	M14A	14-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150 Narrow				
DM74ALS125N	N14A	14-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide				

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Note 1: The Absolute Maximum Ratings are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.
