SEMICONDUCTOR TM

DM74AS169A Synchronous 4-Bit Binary Up/Down Counter

General Description

These synchronous presettable counters feature an internal carry look ahead for cascading in high speed counting applications. The DM74AS169 is a 4-bit binary up/down counter. The carry output is decoded to prevent spikes during normal mode of counting operation. Synchronous operation is provided so that outputs change coincident with each other when so instructed by count enable inputs and internal gating. This mode of operation eliminates the output counting spikes which are normally associated with asynchronous (ripple clock) counters. A buffered clock input triggers the four flip-flops on the rising (positive going) edge of clock input waveform.

These counters are fully programmable; that is, the outputs may each be preset either HIGH or LOW. The load input circuitry allows loading with carry-enable output of cascaded counters. As loading is synchronous, setting up a LOW level at the load input disables the counter and causes the outputs to agree with the data inputs after the next clock pulse.

The carry look-ahead circuitry permits cascading counters for n-bit synchronous applications without additional gating. Both count enable inputs (\overline{P} and \overline{T}) must be LOW to count. The direction of the count is determined by the level of the up/down input. When the input is HIGH, the counter counts UP; when LOW, it counts DOWN. Input T is fed forward to enable the carry outputs. The carry output thus enabled will produce a LOW level output pulse with a duration approximately equal to the HIGH portion of the QA output when counting UP, and approximately equal to the LOW portion of the QA output when counting DOWN. This LOW level overflow carry pulse can be used to enable successively cascaded stages. Transitions at the enable \overline{P} or \overline{T} inputs are allowed regardless of the level of the clock input.

The control functions for these counters are fully synchronous. Changes at control inputs (enable \overline{P} , enable \overline{T} , load, up/down) which modify the operating mode have no effect until clocking occurs. The function of the counter (whether enabled, disabled, loading or counting) will be dictated solely by the conditions meeting the stable setup and hold times.

Ordering Code:

Order Number	Package Number	Package Description
DM74AS169AM	M16A	16-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-012, 0.150 Narrow
DM74AS169AN	N16E	16-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300 Wide
Devices also available	in Tape and Reel. Specify	/ by appending the suffix letter "X" to the ordering code.

© 2000 Fairchild Semiconductor Corporation DS006292

Features

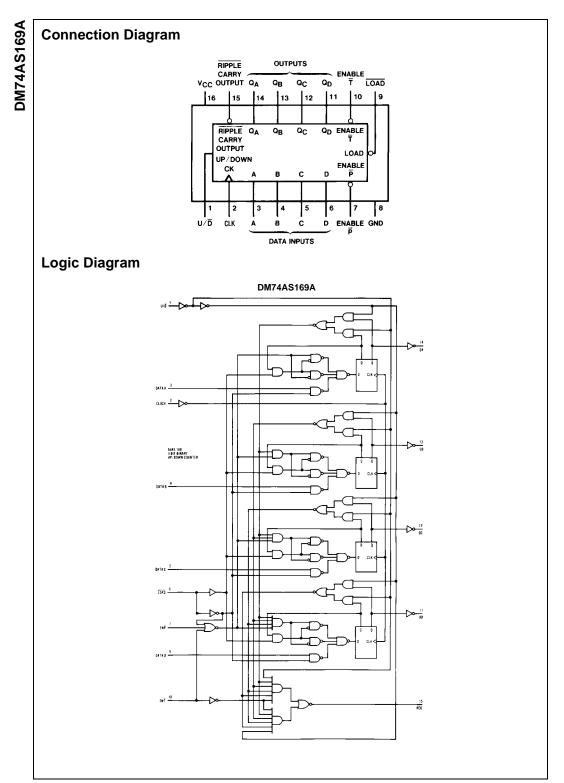

- Switching Specifications at 50 pF
- Switching Specifications guaranteed over full temperature and V_{CC} range

April 1984

Revised March 2000

- Advanced oxide-isolated, ion-implanted Schottky TTL process
- Functionally and pin-for-pin compatible with Schottky and low power Schottky TTL counterpart
- Improved AC performance over Schottky and low power Schottky counterparts
- Synchronously programmable
- Internal look ahead for fast counting
- Carry output for n-bit cascading
- Synchronous counting
- Load control line
- ESD inputs

DM74AS169A Synchronous 4-Bit Binary Up/Down Counter

Absolute Maximum Ratings(Note 1)

Supply Voltage	7V
Input Voltage	7V
Operating Free Air Temperature Range	$0^{\circ}C$ to $+70^{\circ}C$
Storage Temperature Range	$-65^{\circ}C$ to $+150^{\circ}C$
Typical θ _{JA}	
N Package	71.5°C/W
M Package	101.0°C/W

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

t _{PHL}	Propagation Delay Time HIGH-to-LOW Level Output		U/D (Note 3)	RIPPLE Carry	2	13	ns	

Note 3: Propagation delay time from up/down to ripple carry must be measured with the counter at either a minimum or a maximum count. As the logic level of the up/down input is changed, the ripple carry output will follow. If the count is minimum (0), the ripple carry output transition will be in phase. If the count is maximum, the ripple carry output will be out of phase.
