

FDC6301N Dual N-Channel , Digital FET

General Description

These dual N-Channel logic level enhancement mode field effect transistors are produced using Fairchild 's proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on-state resistance. This device has been designed especially for low voltage applications as a replacement for digital transistors. Since bias resistors are not required, these N-Channel FET's can replace several digital transistors, with a variety of bias resistors.

Notes:

- $R_{\theta JA}$ is the sum of the junction-to-case and case-to-ambient thermal resistance where the case thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design while $R_{\theta CA}$ is determined by the user's board design. $R_{\theta JA}$ shown below for single device operation on FR-4 in still air.

a. $140^\circ\text{C}/\text{W}$ on a 0.125 in^2 pad of 2oz copper.

b. $180^\circ\text{C}/\text{W}$ on a 0.005 in^2 pad of 2oz copper.

- Pulse Test: Pulse Width $\leq 300\ \mu\text{s}$, Duty Cycle $\leq 2.0\%$.
