

## MM74HC245A

### Octal 3-STATE Transceiver

#### General Description

The MM74HC245A 3-STATE bidirectional buffer utilizes advanced silicon-gate CMOS technology, and is intended for two-way asynchronous communication between data buses. It has high drive current outputs which enable high speed operation even when driving large bus capacitances. This circuit possesses the low power consumption and high noise immunity usually associated with CMOS circuitry, yet has speeds comparable to low power Schottky TTL circuits.

This device has an active LOW enable input  $\bar{G}$  and a direction control input, DIR. When DIR is HIGH, data flows from the A inputs to the B outputs. When DIR is LOW, data flows from the B inputs to the A outputs. The MM74HC245A transfers true data from one bus to the other.

This device can drive up to 15 LS-TTL Loads, and does not have Schmitt trigger inputs. All inputs are protected from damage due to static discharge by diodes to  $V_{CC}$  and ground.

#### Features

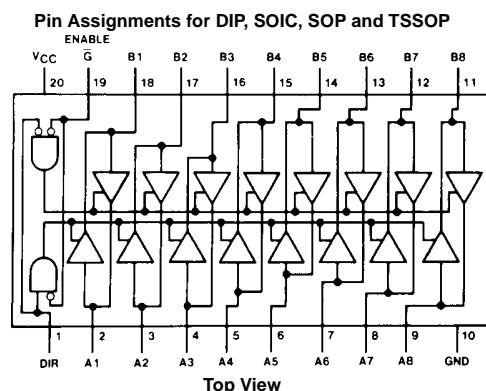

- Typical propagation delay: 13 ns
- Wide power supply range: 2–6V
- Low quiescent current: 80  $\mu$ A maximum (74 HC)
- 3-STATE outputs for connection to bus oriented systems
- High output drive: 6 mA (minimum)
- Same as the 645

#### Ordering Code:

<p><b>Note 4:</b> For a power supply of 5V <math>\pm 10\%</math> the worst case output voltages (<math>V_{OH}</math>, and <math>V_{OL}</math>) occur for HC at 4.5V. Thus the 4.5V values should be used when designing with this supply. Worst case <math>V_{IH}</math> and <math>V_{IL}</math> occur at <math>V_{CC} = 5.5</math>V and 4.5V respectively. (The <math>V_{IH}</math> value at 5.5V is 3.85V.) The worst case leakage current (<math>I_{IN}</math>, <math>I_{CC}</math>, and <math>I_{OZ}</math>) occur for CMOS at the higher voltage and so the 6.0V values should be used.</p>

#### **LIFE SUPPORT POLICY**

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF THE PRESIDENT OF FAIRCHILD SEMICONDUCTOR CORPORATION. As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, and (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component in any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
