MM88C29 • MM88C30 Quad Single-Ended Line Driver • Dual Differential Line Driver

General Description

The MM88C30 is a dual differential line driver that also performs the dual four-input NAND or dual four-input AND function. The absence of a clamp diode to $V_{\rm CC}$ in the input protection circuitry of the MM88C30 allows a CMOS user to interface systems operating at different voltage levels. Thus, a CMOS digital signal source can operate at a $V_{\rm CC}$ voltage greater than the $V_{\rm CC}$ voltage of the MM88C30 line driver. The differential output of the MM88C30 eliminates ground-loop errors.

The MM88C29 is a non-inverting single-wire transmission line driver. Since the output ON resistance is a low 20Ω typ., the device can be used to drive lamps, relays, solenoids, and clock lines, besides driving data lines.

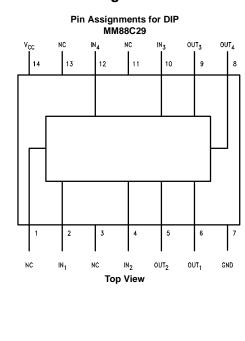

Features

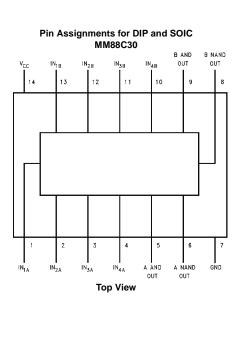

- Wide supply voltage range: 3V to 15V
- High noise immunity: 0.45 V_{CC} (typ.)
- Low output ON resistance: 20Ω (typ.)

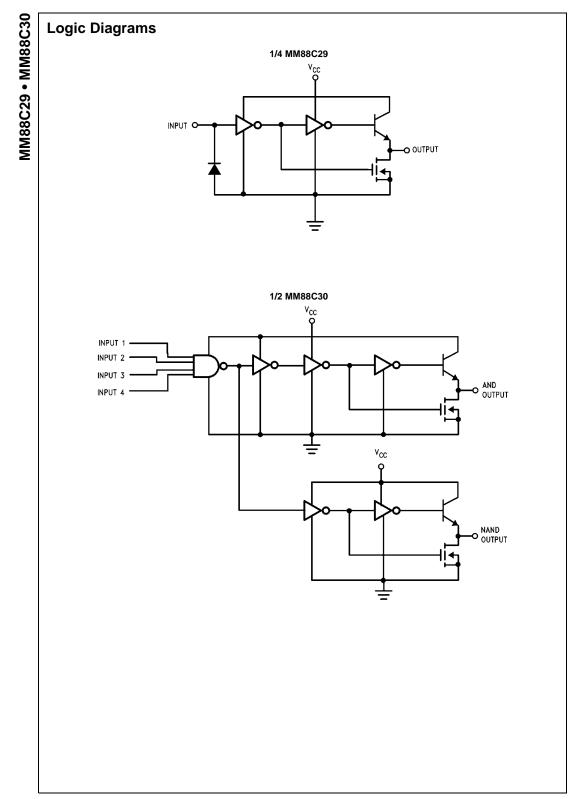

Ordering Code:

Order Number	Package Number	Package Description
MM88C29N	N14A	14-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide
MM88C30M	M14A	14-Lead Small Outline Integrated Circuit (SOIC), JEDEC MS-120, 0.150" Narrow
MM88C30N	N14A	14-Lead Plastic Dual-In-Line Package (PDIP), JEDEC MS-001, 0.300" Wide
Devices also available	in Tape and Reel. Specify	by appending suffix letter "X" to the ordering code.

Note 1: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. Except for "Operating Temperature Range" they are not meant to imply that the devices should be operated at these limits. The Electrical Characteristics tables provide conditions for actual device operation.

Note 2: AC Parameters are guaranteed by DC correlated testing.
