FAN1655
3A DDR Bus Termination Regulator

Features

- Sinks and sources 2.1A continuous, 3A peak
- 0 to +125°C operating temperature range
- 5mA Buffered VREFOUT = VDDQ/2
- Load regulation: VTT = VREFOUT ± 40mV
- On-chip thermal limiting
- Low Cost SO-14, Power Enhanced eTSSOP or 8-pin 5x6mm MLP packages
- Low-Current Shutdown Mode
- Output Short Circuit Protection

Applications

- DDR Terminator VTT supply

Description

The FAN1655 is a low-cost bi-directional LDO specifically designed for terminating DDR memory bus. It can both sink and source up to 2.1A continuous, 3A peak, providing enough current for most DDR applications. Load regulation meets the JEDEC spec, VTT = VREFOUT ± 40mV.

The FAN1655 includes a buffered reference voltage capable of supplying up to 5mA current. On-chip thermal limiting provides protection against a combination of power overload and ambient temperature that would create an excessive junction temperature. A shutdown input puts the FAN1655 into a low power mode.

The FAN1655 regulator is available in a power-enhanced eTSSOP™-16 package, and the standard SOIC-14
Block Diagram
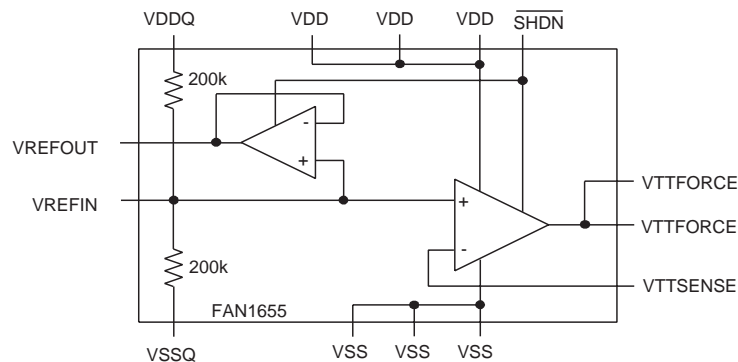

Pin Assignments
16-Lead Plastic eTSSOP-16
$\theta_{JC} = 4°C/W*$
*With package power slug soldered to 0.5 square inch copper area over backside ground plane of internal power plane

14-Lead Plastic SOIC
$\theta_{JC} = 37°C/W, \theta_{JA} = 88°C/W$

8-Lead MLP Package (5x6mm)
$\theta_{JC} = 4°C/W, \theta_{JA} = 34°C/W$ as measured on FAN1655MP Eval Board

Pin Definitions

| Pin				
MLP	**eTSSOP**	**SOIC-14**	**Pin Name**	**Pin Function Description**
1, 4	1, 2, 7	1, 2, 7	VDD	Input power for the LDO.
2, 3	3, 6	3, 6	VTTFORCE	The VTT output voltage.
PAD	4, 5, 8	4, 5, 8	VSS	IC Ground.
5	10	9	VTTSENSE	Feedback for remote sense of the VTT voltage.
	11	10	VREFIN	Alternative input for direct control of VTTOUT and VREFOUT.
6	12	11	$\overline{\text{SHDN}}$	Shutdown. This active low shutdown turns off both VTT and VREFOUT. This pin has an internal pull-down, and must be externally driven high for the IC to be on.
	13	12	VSSQ	Signal Ground.
7	14	13	VREFOUT	Buffered Voltage Reference Output.
8	15	14	VDDQ	VDDQ Input. Attach this pin to the VDDQ supply to generate VTT and VREFOUT.
	9, 16		NC	No Internal Connection

$\overline{SHDN}$ Input Current	$\overline{SHDN}$ = 2.7V	•		50	75	µA
Over-Temperature Shutdown				155		˚C
Over-Temperature Hysteresis				30		˚C

Applications Information

Output Capacitor selection

The JEDEC specification for DDR termination requires that VTT stay within ±40mV of VREF, which must track VDDQ/2 within 1%. During the initial load transient, the output capacitor keeps the output within spec. To stay within the 40mV window, the "load step" due to the load transient current dropping across the output capacitor's ESR should be kept to around 25mV: where ESR < $\frac{25}{\Delta I}$ is given in mΩ, and ΔI is the maximum load current.

For example, to handle a 3A maximum load transient, the ESR should be no greater than 8mΩ. Furthermore, the output capacitor must be able to hold the load in spec while the regulator recovers (about 15μS). A minimum value of 470μF is recommended.

These requirements can be achieved by a combination of capacitors. FAN1655 requires a minimum of 5mΩ of ESR in the output and is not stable with all-ceramic output capacitors.

Power Dissipation and Derating

The maximum output current (sink or source) for a 1.25V output is:

$$I_{OUT(MAX)} = \frac{P_{D(MAX)}}{1.25} \tag{1}$$

where $P_{D(MAX)}$ is the maximum power dissipation which is:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{\theta_{JA}} \tag{2}$$

where $T_{J(MAX)}$ is the maximum die temperature of the IC and T_A is the operating ambient temperature.

FAN1655 has an internal thermal limit at 150°C, which defines $T_{J(MAX)}$. For the SOIC-14 package, θ_{JA} is given at 88°C/W. Using equation 2, the maximum dissipation at $T_A = 25°C$ is 1.4W, which is its rated maximum dissipation.

The e-TSSOP or MLP package, however, use the PCB copper to cool the IC through the thermal pad on the package bottom. For maximum dissipation, this pad should be soldered to the PCB copper, with as much copper area as possible surrounding it to cool the package. Thermal vias should be placed as close to the thermal pad as possible to transfer heat to other layers of copper on the PCB. With large areas of PCB copper for heat sinking, a θ_{JA} of under 40°C/W can easily be achieved.
Mechanical Dimensions

16 Lead eTSSOP
NOTES:

A. CONFORMS TO JEDEC REGISTRATION MO-153, VARIATION ABT,
   DATED 10/97.
B. DIMENSIONS ARE IN MILLIMETERS.
C. DIMENSIONS ARE EXCLUSIVE OF BURRS, MOLD FLASH,
   AND THE BAR EXTENSIONS.
D. DIMENSIONS AND TOLERANCES PER ASME Y14.5M, 1994.

Mechanical Dimensions

14-Lead SOIC

NOTES:

1. This package conforms to JEDEC MS-012, variation AB, ISSUEC dated May, 1990.

2. All dimensions are in millimeters

3. Standard lead finished

   200 microinches / 5.08 microns min.
