## Electrical Characteristics

V<sub>IN</sub> = 5V, I<sub>O</sub> = 1A, C<sub>IN</sub> = 1μF, C<sub>OUT</sub> = 10μF, All specifications apply for T<sub>A</sub> = T<sub>J</sub> = 25°C. [Note 3]

**Note 1:** Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Conditions are conditions under which the device functions but the specifications might not be guaranteed. For guaranteed specifications and test conditions see the Electrical Characteristics.

**Note2:** The maximum power dissipation is a function of the maximum junction temperature, T<sub>Jmax</sub>; total thermal resistance, θ<sub>JA</sub>, and ambient temperature T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is T<sub>Jmax</sub> - T<sub>A</sub> / θ<sub>JA</sub>. If this dissipation is exceeded, the die temperature will rise above 150°C and IC will go into thermal shutdown. For the G960 in the SOT 223 package, θ<sub>JA</sub> is 156°C/W; in the TO 252 package, θ<sub>JA</sub> is 125°C/W; in the TO 263 package, θ<sub>JA</sub> is 75°C/W, and in the TO 220 package, θ<sub>JA</sub> is 60°C/W (No heat sink). [See Recommended Minimum Footprint] If the TO 220 package is used with a heat sink, θ<sub>JA</sub> is the sum of the package thermal resistance junction-to-case (θ<sub>JC</sub>) of 3°C/W and the thermal resistance added by the heat sink and thermal interface the thermal resistance can be reduced by increasing the P.C. board copper area thermally connected to the package. The safe operation area of SOT 223, TO 252, TO 263 or TO 220 package, it can see "Typical Performance Characteristics" (Safe Operating Area).

**Note3:** Low duty pulse techniques are used during test to maintain junction temperature as close to ambient as possible.

**Note4:** The type of output capacitor should be tantalum or aluminum.

## Definitions

### Dropout Voltage

The input/output Voltage differential at which the regulator output no longer maintains regulation against further reductions in input voltage. Measured when the output drops 100mV below its nominal value, dropout voltage is affected by junction temperature, load current and minimum input supply requirements.

### Line Regulation

The change in output voltage for a change in input voltage. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

### Load Regulation

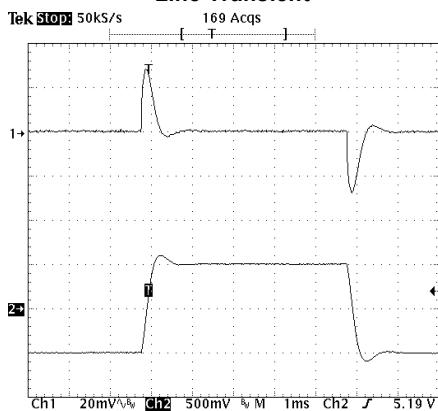

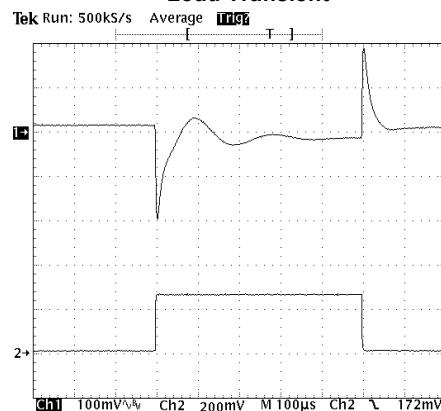

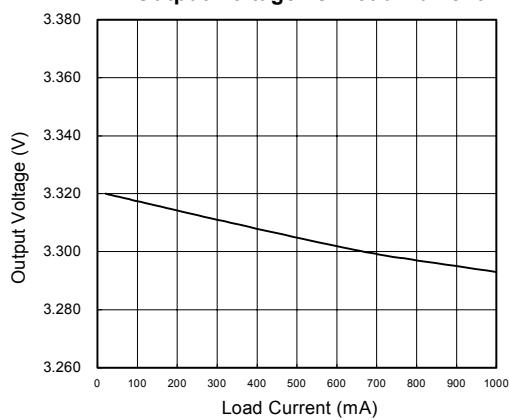

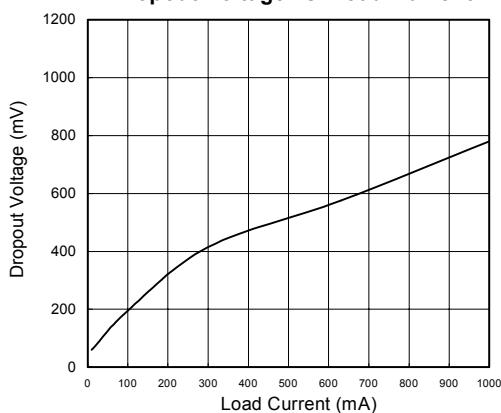

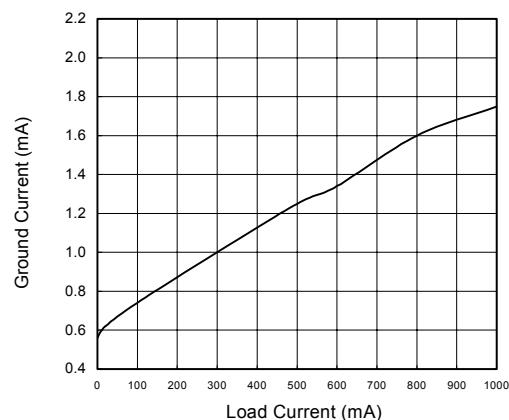

The change in output voltage for a change in load current at constant chip temperature. The measurement is made under conditions of low dissipation or by using pulse techniques such that average chip temperature is not significantly affected.

### Maximum Power Dissipation

The maximum total device dissipation for which the regulator will operate within specifications.

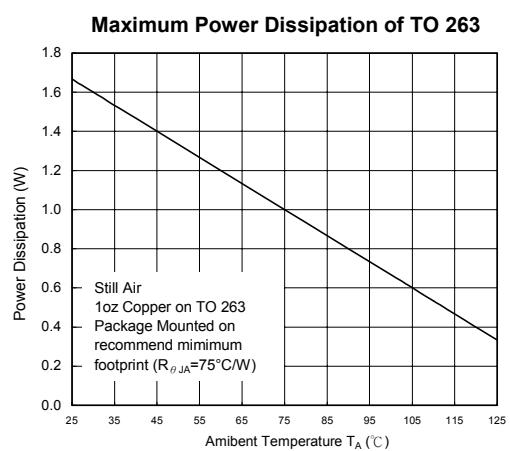

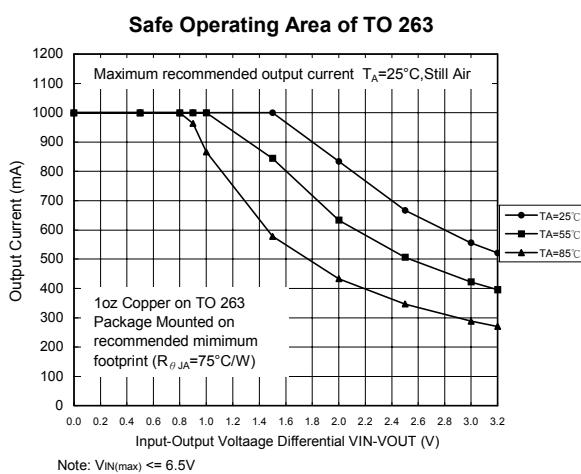

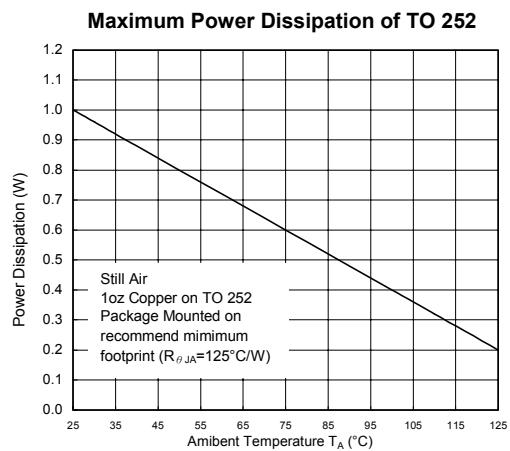

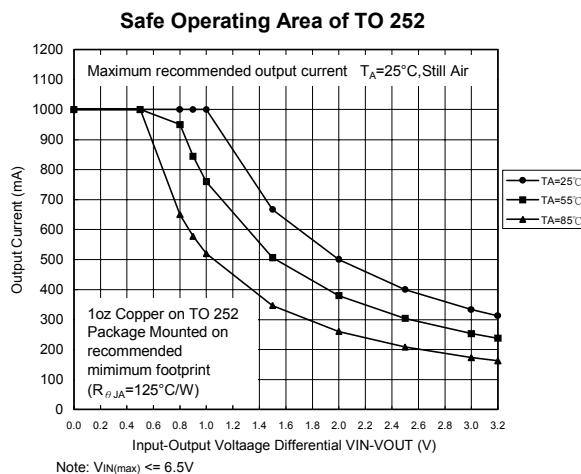

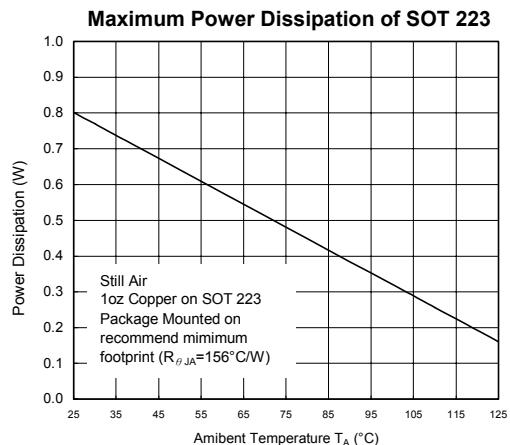

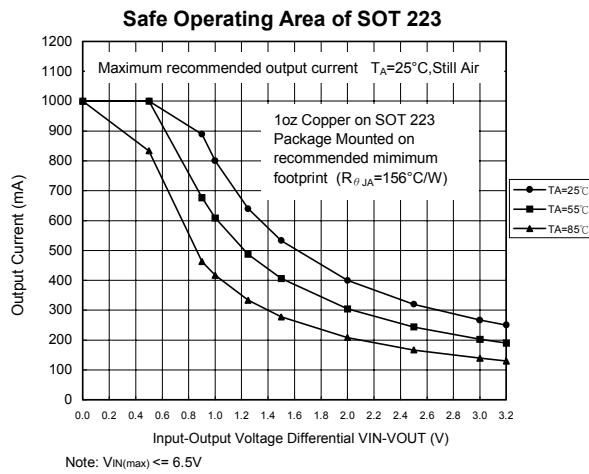

### Quiescent Bias Current

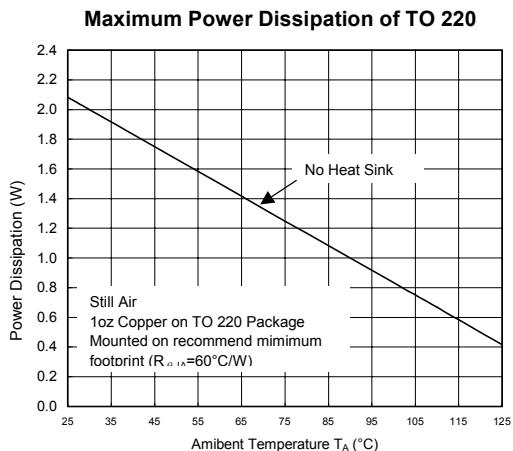

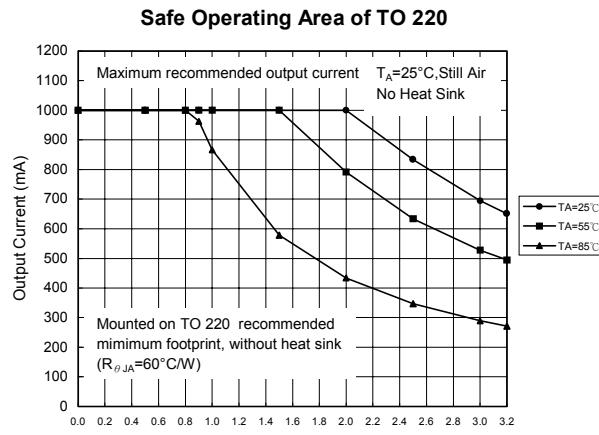

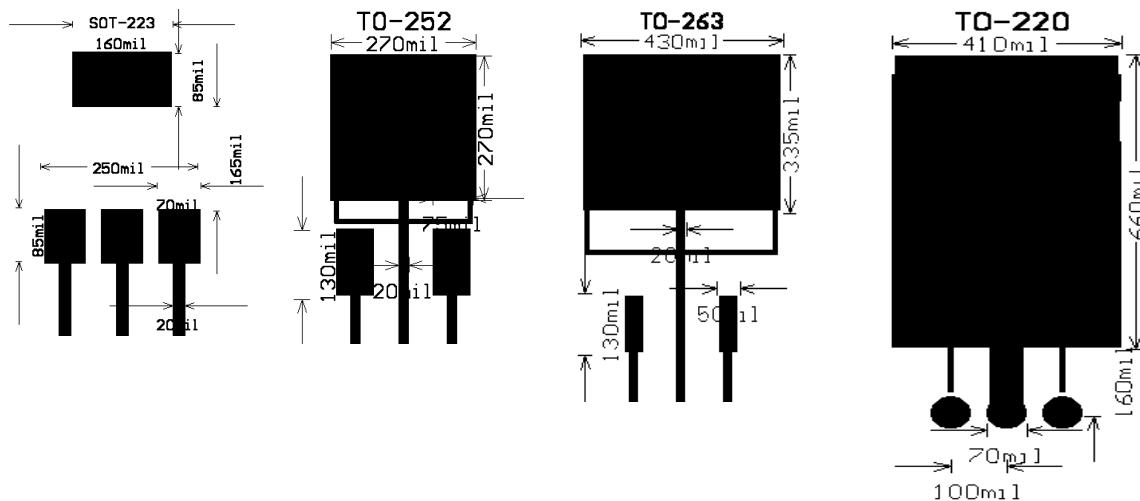

Current which is used to operate the regulator chip and is not delivered to the load.
