Note: 1. Transition is measured ±200 mV from steady voltage with Load (B). This parameter is sampled and not 100% tested.

2. Address should be valid prior to or coincident with $\overline{CS}$ transition low.

3. $\overline{WE}$ and/or $\overline{CS}$ must be high during address transition time.

4. if $\overline{CS}$ and $\overline{OE}$ are low during this period, Dout pins are in the output state. Then, the data input signals of opposite phase to the outputs must not be applied to them.

5. If the $\overline{CS}$ low transition occurs simultaneously with the $\overline{WE}$ low transition or after the $\overline{WE}$ transition, output remains a high impedance state.

6. t_{AS} is measured from the latest address transition to the later of $\overline{CS}$ or $\overline{WE}$ going low.

7. t_{WR} is measured from the earlier of $\overline{CS}$ or $\overline{WE}$ going high to the first address transition.

8. A write occurs during the overlap of a low $\overline{CS}$ and a low $\overline{WE}$. A write begins at the latest transition among $\overline{CS}$ going low and $\overline{WE}$ going low. A write ends at the earliest transition among $\overline{CS}$ going high and $\overline{WE}$ going high. t_{WP} is measured from the beginnig of write to the end of write.

9. t_{CW} is measured from the later of $\overline{CS}$ going low to the the end of write.
