
HA12226F/HA12227F

Audio Signal Processor for Cassette Deck
(Dolby B-type NR with Recording System)

HITACHI

ADE-207-270E (Z)

6th Edition
Dec. 2000

Description

The HA12226F/HA12227F are silicon monolithic bipolar IC providing Dolby noise reduction system*¹, music sensor system, REC equalizer system and each electronic control switch in one chip.

Note: 1. Dolby is a trademark of Dolby Laboratories Licensing Corporation.

A license from Dolby Laboratories Licensing Corporation is required for the use of this IC.

The HA12227F is not built-in Dolby B-NR.

Functions

- Dolby B-NR*² × 2 channel
- REC equalizer × 2 channel
- Music sensor × 1 channel
- Pass amp. × 2 channel
- Each electronic control switch to change REC equalizer, bias, etc.

Note: 2. The HA12227F is not built-in Dolby B-NR.

Features

- REC equalizer is very small number of external parts and have 4 types of frequency characteristics built-in.
- 2 types of input for PB, 1 type of input for REC.
- 70μ - PB equalizer changing system built-in.
- Dolby NR*² with dubbing double cassette decks.
Unprocessed signal output available from recording out terminals during PB mode.
- Provide stable music sensor system, available to design music sensing time and level.
- Controllable from direct micro-computer output.
- Bias oscillator control switch built-in.
- NR ON / OFF and REC / PB fully electronic control switching built-in.
- Normal-speed / high-speed, Normal / Crom and PB equalizer fully electronic control switching built-in.
- Available to reduce substrate-area because of high integration and small external parts.

HA12226F/HA12227F

Ordering Information

Operating Voltage

Product	Power Supply Range (Single Supply)
HA12226F	11.0 V to 15.0 V
HA12227F	9.5 V to 15.0 V

Standard Level

Product	Package	PB-OUT Level	REC-OUT Level	Dolby Level
HA12226F	FP-56A	580 mVrms	300 mVrms	300 mVrms
HA12227F				—

Function

Product	Dolby B-NR	REC-EQ	Music Sensor	Pass Amp.	REC / PB Selection	ALC
HA12226F	○	○	○	○	○	○
HA12227F	×	○	○	○	○	○

Note: Depending on the employed REC / PB head and test tape characteristics, there is a rare case that the REC-EQ characteristics of this LSI can not be matched to the required characteristics because of built-in resistors which determined the REC-EQ parameters in this case, please inquire the responsible agent because the adjustment built-in resistor is necessary.

Difference of HA12215F and HA12226F/HA12227F

Product	Supply Voltage	Tape Correspondence		
		NORM	CROM	METAL
HA12226F/HA12227F	Single supply voltage	○	○	×
HA12215F	Split supply voltage	○	○	○

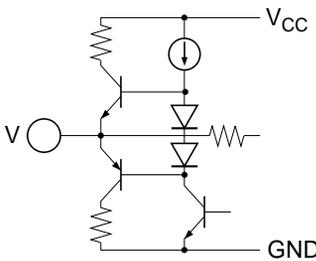

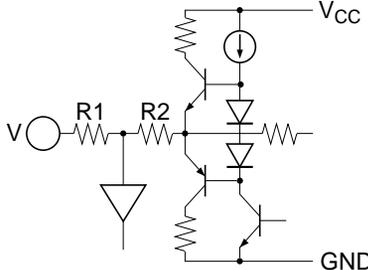

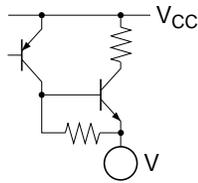

Note: The HA12226F/HA12227F became single power supply for the HA12215F and deleted metal correspondence. The HA12227F is not built-in Dolby B-NR.
Other characteristic aspects are similar as the HA12215F.

Pin Description, Equivalent Circuit ($V_{CC} = 12\text{ V}$, A system of single supply voltage, $T_a = 25^\circ\text{C}$, No Signal, The value in the show typical value.)

Pin No.	Terminal Name	Note	Equivalent Circuit	Pin Description
51	AIN (R)	$V = V_{CC} / 2$		PB A Deck input
48	AIN (L)			
53	BIN (R)			PB B Deck input
46	BIN (L)

HA12226F/HA12227F

Functional Description

Power Supply Range

These ICs are designed to operate on single supply.

Table 1 Supply Voltage

Product	Power Supply Range (Single Supply)
HA12226F	11.0 V to 15.0 V
HA12227F	9.5 V to 15.0 V

Note: The lower limit of supply voltage depends on the line output reference level.
The minimum value of the overload margin is specified as 12 dB by Dolby Laboratories (Dolby IC HA12226F).

Reference Voltage

The reference voltage are provided for the left channel and the right channel separately. The block diagram is shown as figure 1.

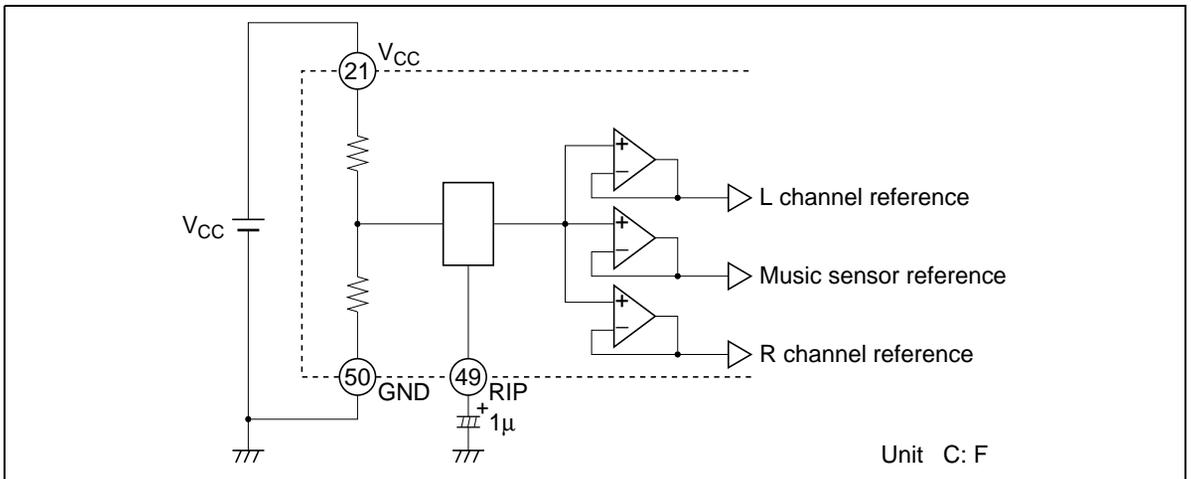

Figure 1 Reference Voltage

HA12226F/HA12227F

PB Equalizer

By switching logical input level of pin 17 (for Ain) and pin 19 (for Bin), you can equalize corresponding to tape position at play back mode.

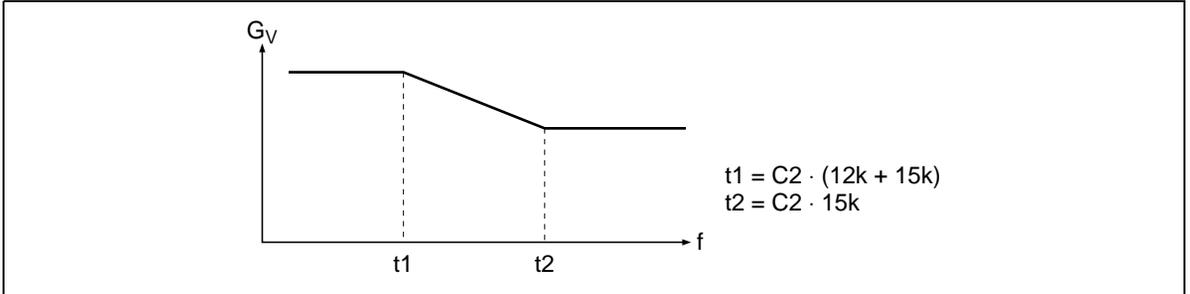

Figure 3 Frequency Characteristic of PB Equalizer

The Sensitivity Adjustment of Music Sensor

Adjusting MS Amp gain by external resistor, the sensitivity of music sensor can set up.

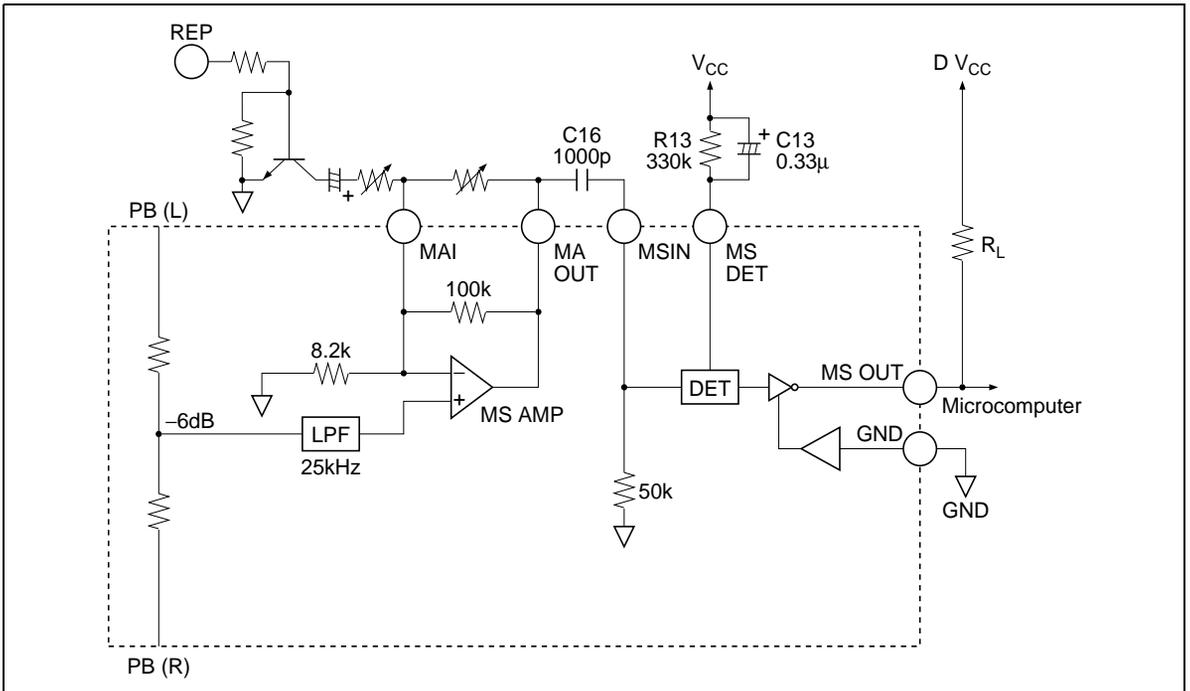

Figure 4 Music Sensor Block Diagram

The Sensitivity of Music Sensor

A standard level of MS input pin 25.9 mVrms, therefore, the sensitivity of music sensor (S) can request it, by lower formulas.

$$A = \text{MS Amp Gain} \cdot 1$$

$$B = \text{PB input Gain} \times (1/2)^2 \quad S = 20 \log \frac{C}{25.9 \cdot A \cdot B} \text{ [dB]}$$

$$C = \text{Sensed voltage}$$

$$20 \log (A \times B) = D \text{ [dB]} \quad S = 14 - D \text{ [dB]}$$

$$C = 130 \text{ [mVrms]} \text{ (Intenally voltage in a standard)}$$

$$\text{PB input Gain} = 21.3 \text{ [dB]}$$

- Notes: 1. When there is not a regulation outside.
 2. Case of one-sided channel input.

But necessary to consider the same attenuation quantity practically, on account of A(B) have made frequency response.

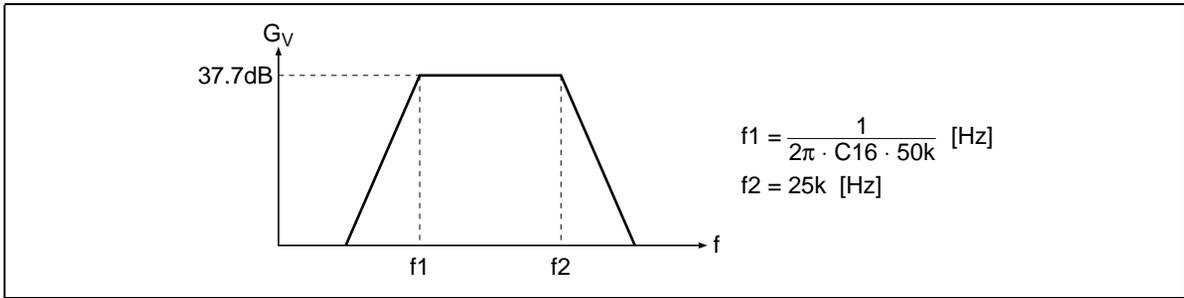

Figure 5 Frequency Characteristic of MSIN

Occasion of the external component of figure 4, f1 is 3.18 kHz.

Time constant of detection

Figure 6(1) generally shows that detection time is in proportion to value of capacitor C13. But, with Attack*² and Recovery*³ the detection time differs exceptionally.

- Notes 2. Attack : Non-music to Music
 3. Recovery : Music to Non-music

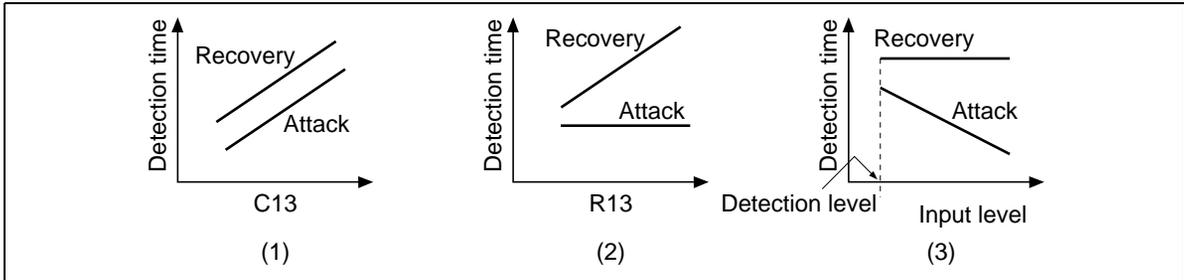

Figure 6 Function Characteristic of MS

Like the figure 6(2), Recovery time is variably possible by value of resistor R13. But Attack time gets about fixed value. Attack time has dependence by input level. When a large signal is inputted, Attack time is short tendency.

HA12226F/HA12227F

Music Sensor Output (MSOUT)

As for internal circuit of music sensor block, music sensor output pin is connected to the collector of NPN type directly, output level will be “high” when sensing no signal. And output level will be “low” when sensing signal.

Connection with microcomputer, it is requested to use external pull up resistor ($R_L = 10\text{ k}\Omega$ to $22\text{ k}\Omega$)

Note: Supply voltage of MSOUT pin must be less than V_{CC} voltage.

The Tolerances of External Components for Dolby NR-Block (Only the HA12226F)

For Dolby NR precision securing, please use external components shown at figure 7. If leak-current are a few electrolytic-capacitor, it can be applicable to C5 and C23.

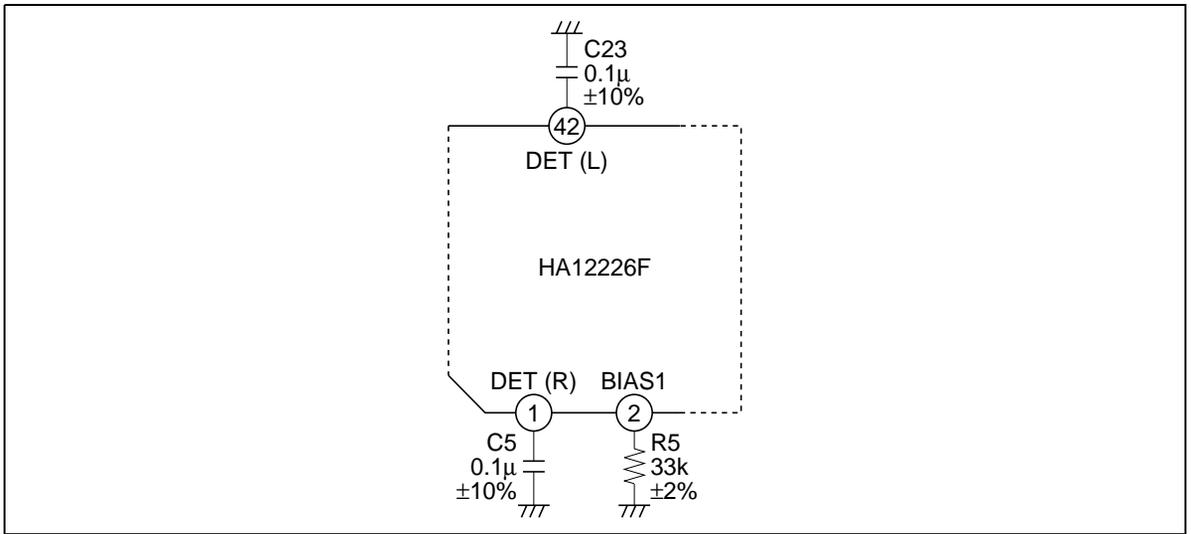

Figure 7 Tolerance of External Components

Low-Boost

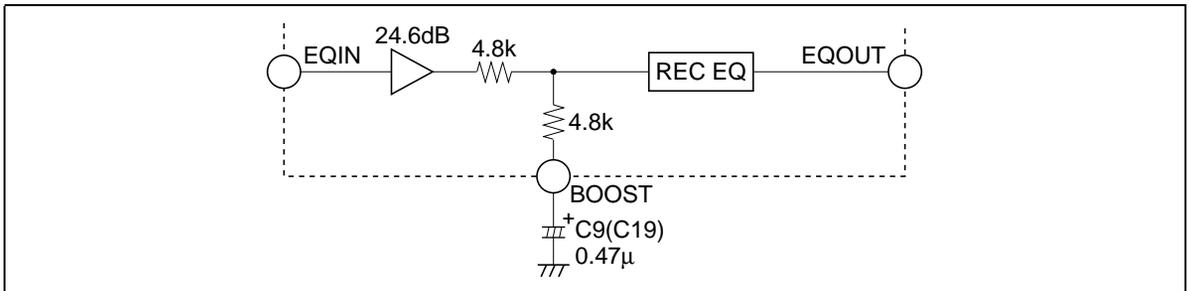

Figure 8 Example of Low Boost Circuit

External components shown figure 8 gives frequency response to take 6 dB boost. And cut off frequency can request it, by C9 (C19).

REC Equalizer

The outlines of REC Equalizing frequency characteristics are shown by figure 9. Those peak level can be set up by supplying voltage. (0 V to 5 V, GND = 0 V) to pin 10 (GPCAL).

And whole band gain can be set up by supplying voltage (0 V to 5 V, GND = 0 V) to pin 11 (RECCAL).

Both setting up range are ±4.5 dB. In case that you do not need setting up, pin 10, pin 11 should be open bias.

Note: Depending on the employed REC/PB head and test tape characteristics, there is a rare case that the REC-EQ characteristics of this LSI can not be matched to the required characteristics because of built-in resistors which determined the REC-EQ parameters in this case, please inquire the responsible agent because of the adjustment of built-in resistor is necessary.

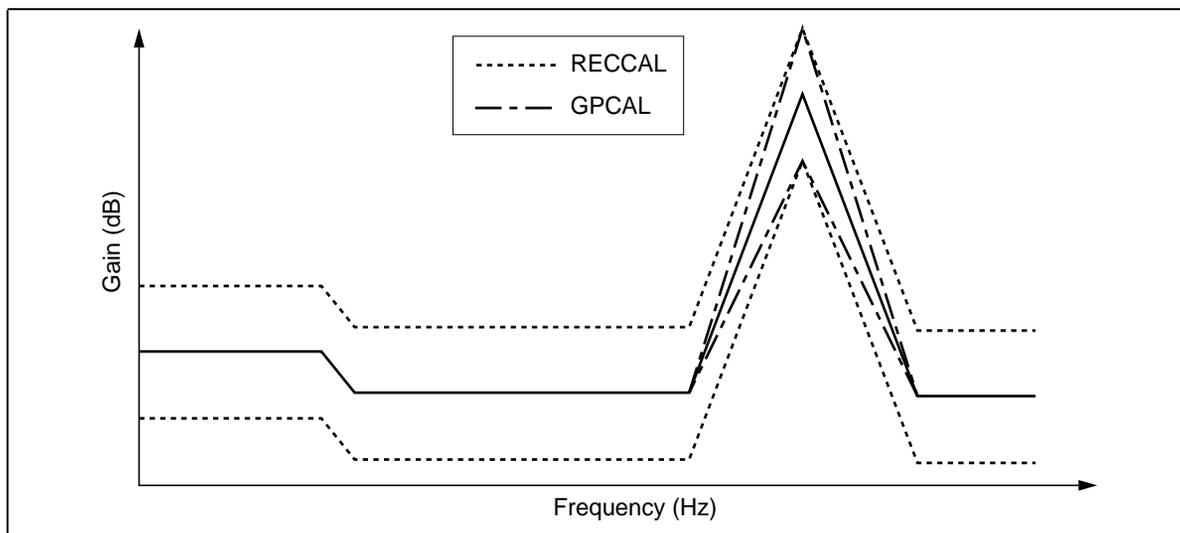

Figure 9 Frequency Characteristics of REC Equalizer

Bias Switch

The HA12215F built-in DC voltage generator for bias oscillator and its bias switches.

External resistor R20, R21 which corresponded with tape positions and bias out voltage are related with below.

$$V_{bias} \approx \left(\frac{R22}{(R20 \text{ or } R21) + R22} \right) \times (V_{CC} - 0.7) \text{ [V]}$$

Bias switch follows to a logic of pin 19 (B / Norm / Crom).

Note: A current that flows at bias out pin, please use it less than 5 mA.

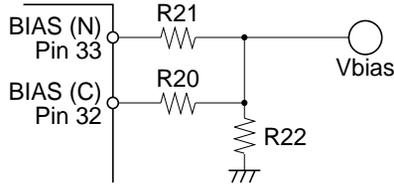

Figure 10 External Components of Bias Block

Automatic Level Control

ALC is the input decay rate variable system. It has internal variable resistors of pin 55 (pin 44) by RECOU signal that is inputted to pin 9 (pin 34).

The operation is similitude to MS, detected by pin 13.

The signal input pin is pin 56 (pin 43). Resistor R1, R2 and capacitor C2, external components, for the input circuit are commended as figure 12. There are requested to use value of the block diagram figure for performance maintenance of S/N, T.H.D. etc.

Figure 11 shows the relation with R1 front RIN point and ROUT.

ALC operation level acts for the center of +4.5 dB at tape position TYPE I and the center of +2.5 dB at tape position TYPE II, to standard level (300 mVrms).

Then, adopted maximum value circuit, ALC is operated by a large channel of a signal.

ALC ON/OFF can switch it by pin 15. Please do ALC ON, after it does for one time ALC OFF inevitably, for ALC time to start usefully (when switching PB → PASS, when switching PB → PASS), in order to reset ALC circuit.

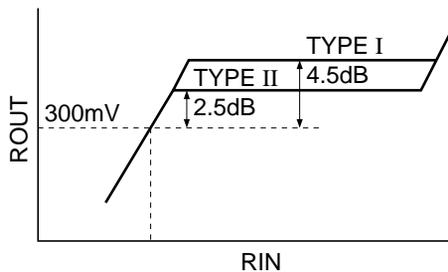

Figure 11 ALC Operation Level

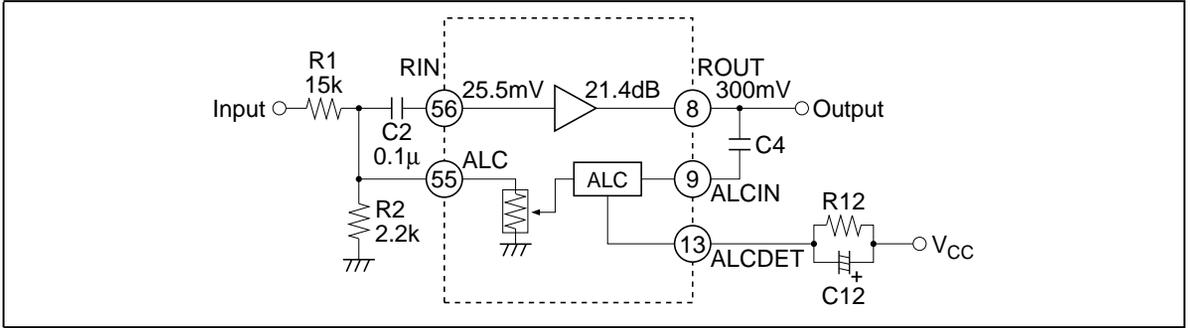

Figure 12 ALC Block Diagram

ALC Operation Level Necessary

ALC operation level is variable to pin 12 bias (ALC-CAL: 0 to 5 V), and its range is ± 4.0 dB.

Unnecessary, pin 12 is unforced.

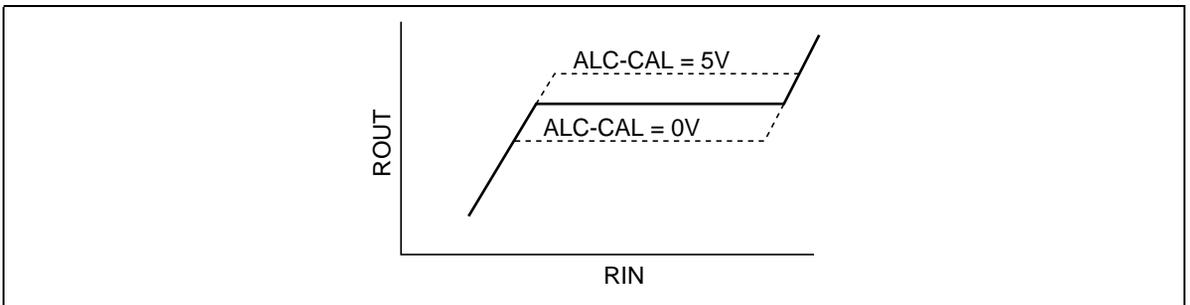

Figure 13 ALC-CAL Characteristics

About a Test Pin (Pin 2)

The HA12227F does for testing exclusive terminal for pin 2.

In mount circuit, this terminal is open or connected to GND with a resistor of 33 k Ω .

Test Circuit

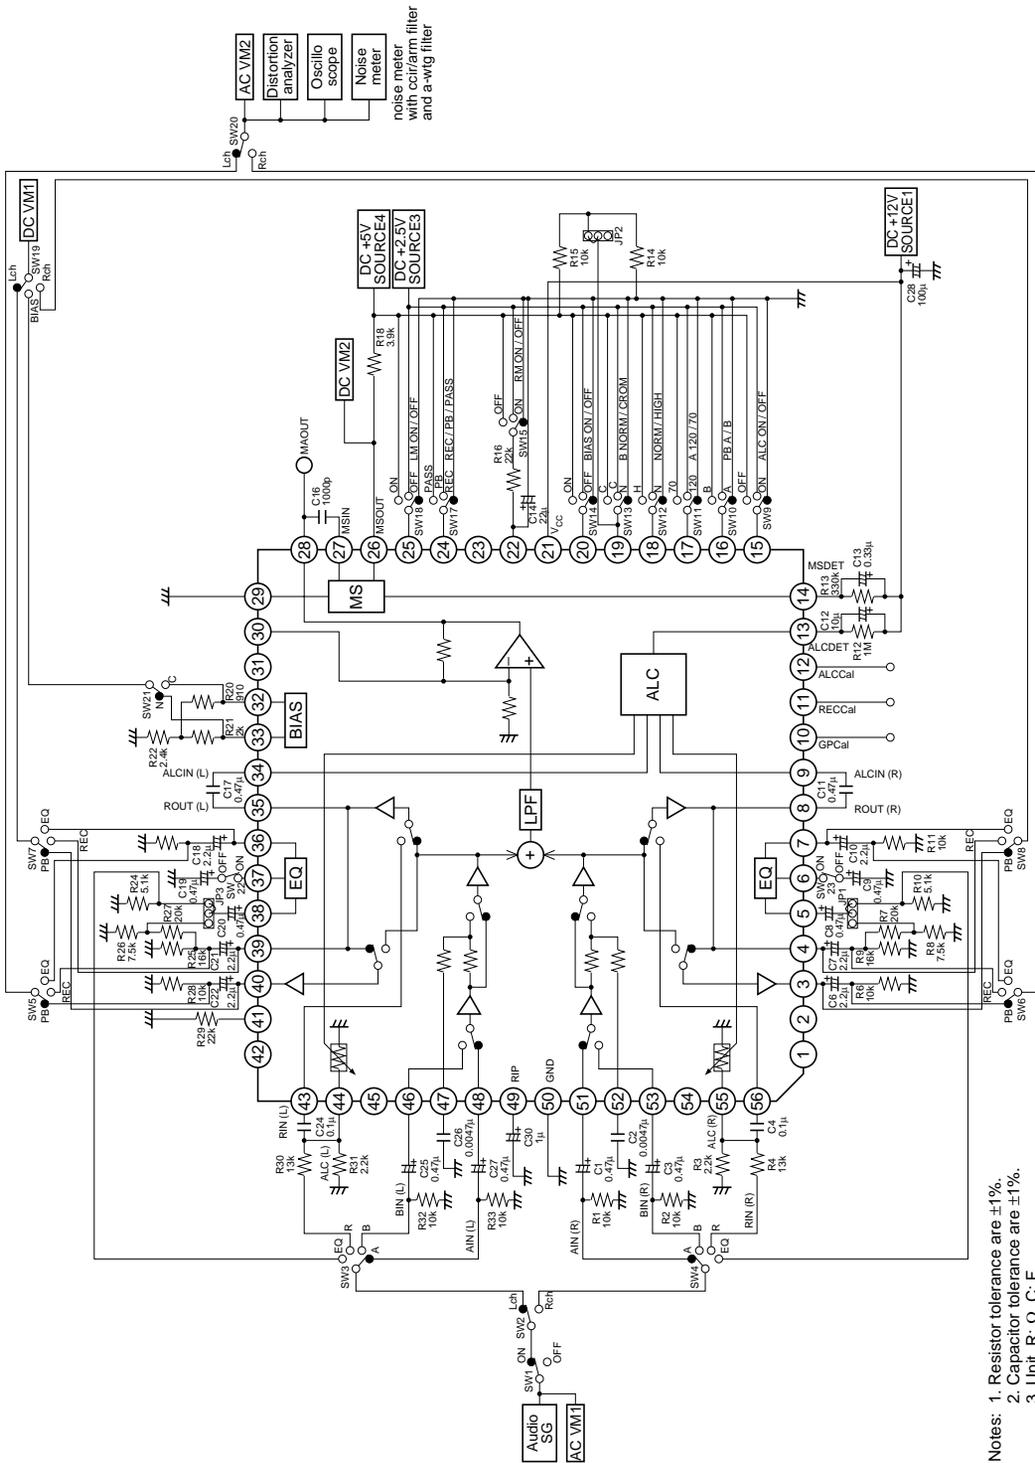

HA12226F

Notes: 1. Resistor tolerance are ±1%.
 2. Capacitor tolerance are ±1%.
 3. Unit R, Ω, C, F.

HA12226F/HA12227F

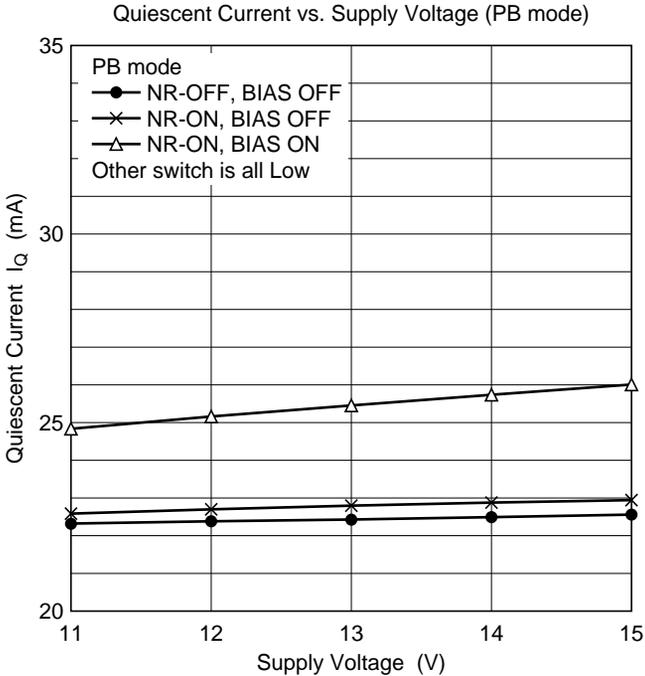

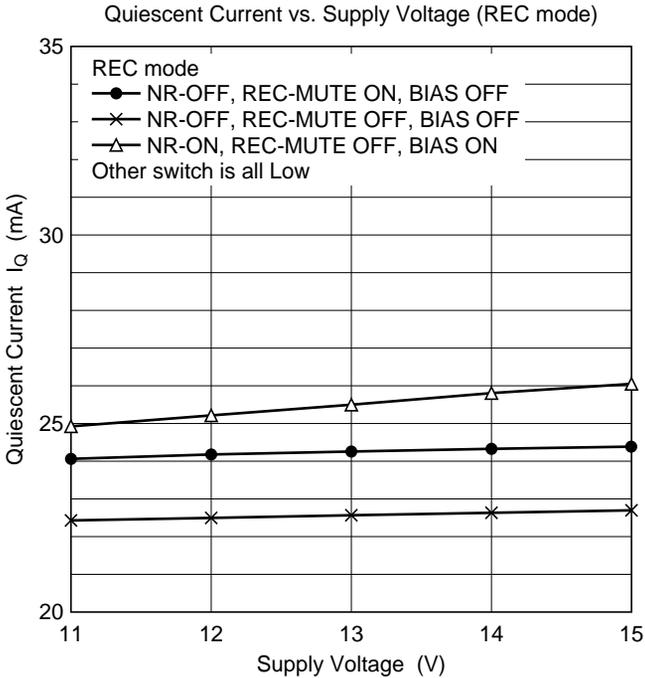

HA12227F

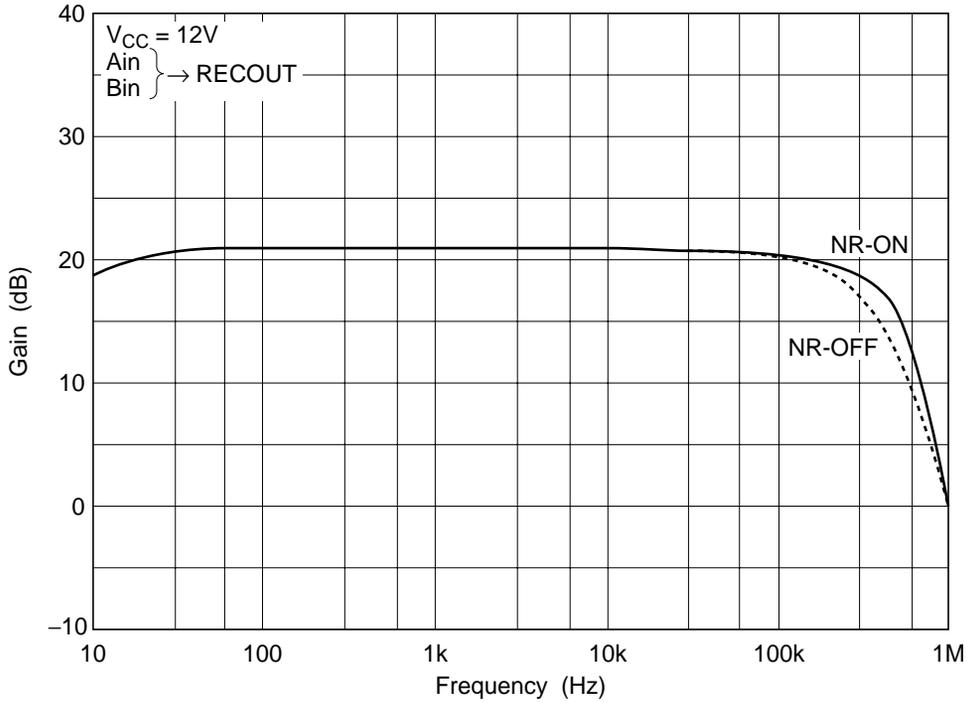

Notes: 1. Resistor tolerance are $\pm 1\%$.
 2. Capacitor tolerance are $\pm 1\%$.
 3. Unit R: Ω , C: F.

Package Dimensions

Unit: mm

*Dimension including the plating thickness
 Base material dimension

Hitachi Code	FP-56A
JEDEC	—
EIAJ	—
Mass (reference value)	0.5 g

Disclaimer

1. Hitachi neither warrants nor grants licenses of any rights of Hitachi's or any third party's patent, copyright, trademark, or other intellectual property rights for information contained in this document. Hitachi bears no responsibility for problems that may arise with third party's rights, including intellectual property rights, in connection with use of the information contained in this document.
2. Products and product specifications may be subject to change without notice. Confirm that you have received the latest product standards or specifications before final design, purchase or use.
3. Hitachi makes every attempt to ensure that its products are of high quality and reliability. However, contact Hitachi's sales office before using the product in an application that demands especially high quality and reliability or where its failure or malfunction may directly threaten human life or cause risk of bodily injury, such as aerospace, aeronautics, nuclear power, combustion control, transportation, traffic, safety equipment or medical equipment for life support.
4. Design your application so that the product is used within the ranges guaranteed by Hitachi particularly for maximum rating, operating supply voltage range, heat radiation characteristics, installation conditions and other characteristics. Hitachi bears no responsibility for failure or damage when used beyond the guaranteed ranges. Even within the guaranteed ranges, consider normally foreseeable failure rates or failure modes in semiconductor devices and employ systemic measures such as fail-safes, so that the equipment incorporating Hitachi product does not cause bodily injury, fire or other consequential damage due to operation of the Hitachi product.
5. This product is not designed to be radiation resistant.
6. No one is permitted to reproduce or duplicate, in any form, the whole or part of this document without written approval from Hitachi.
7. Contact Hitachi's sales office for any questions regarding this document or Hitachi semiconductor products.
