HT23C256

CMOS 32K×8-Bit Mask ROM

Features

- Operating voltage 2.7V~5.5V
- Low power consumption
  - Operation: 25mA max. (V_{CC}=5V)
    10mA max. (V_{CC}=3V)
  - Standby: 30μA max. (V_{CC}=5V)
    10μA max. (V_{CC}=3V)
- Access time:150ns max. (V_{CC}=5V)
  250ns max. (V_{CC}=3V)
- 32768×8 bits of mask ROM
- Mask options: chip enable CE/$\overline{CE}$/OE1/$\overline{OE1}$ and output enable OE/$\overline{OE}$/NC
- TTL compatible inputs and outputs
- Tristate outputs
- Fully static operation
- Package type: 28-pin DIP/SOP

General Description

The HT23C256 is a read-only memory with high performance CMOS storage device whose 256K of memory is arranged into 32768 words by 8 bits.

For application flexibility, the chip enable and output enable control pins can be selected as active high or active low. This flexibility not only allows easy interface with most microprocessors, but also eliminates bus contention in multiple bus microprocessor systems. An additional feature of the HT23C256 is its ability to enter the standby mode whenever the chip enable (CE/$\overline{CE}$) is inactive, thus reducing current consumption to below 30μA. The combination of these functions makes the chip suitable for high density low power memory applications.

Functional Description

The HT23C256 has two modes, namely data read mode and standby mode, controlled by CE/$\overline{CE}$/OE1/$\overline{OE1}$ and OE/OE/NC inputs.

- Standby mode

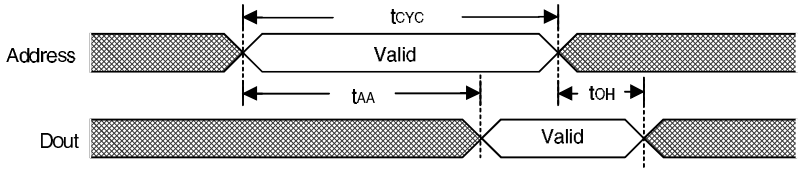
  The HT23C256 has lower current consumption, controlled by the chip enable input (CE/$\overline{CE}$). When a low/high level is applied to the CE/$\overline{CE}$ input regardless of the output enable (OE/$\overline{OE}$/NC) states the chip will enter the standby mode.

- Data read mode

  When both the chip enable (CE/$\overline{CE}$/OE/$\overline{OE1}$) and the output enable (OE/$\overline{OE}$/NC) are active, the chip is in data read mode. Otherwise, active CE/$\overline{CE}$ and inactive OE/$\overline{OE}$/NC result in deselect mode. The output will remain in Hi-Z state.

Timing Diagrams

- Propagation delay due to address (CE/$\overline{CE}$/OE1/$\overline{OE1}$ and OE/$\overline{OE}$ are active)



- Propagation delay due to chip enable and output enable (address valid)
