

Pentium/Pro™ System Clock Chip

General Description

The **ICS9148-60** is part of a reduced pin count two-chip clock solution for designs using an Intel BX style chipset. Companion SDRAM buffers are ICS9179-11 and -12.

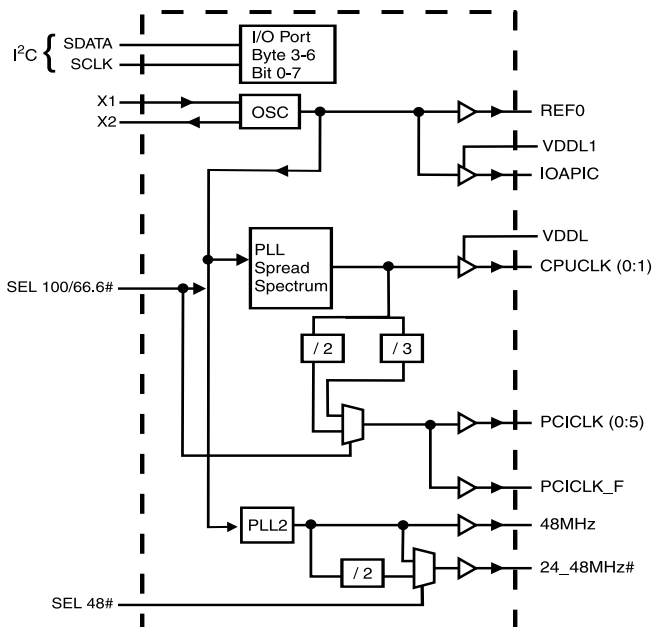

There are two PLLs, with the first PLL capable of spread spectrum operation. Spread spectrum typically reduces system EMI by 8-10dB. The second PLL provides support for USB (48MHz) and 24MHz requirements. CPU frequencies up to 100MHz are supported.

The I²C interface allows stop clock programming, frequency selection, and spread spectrum operation to be programmed. Clock outputs include two CPU (2.5V or 3.3V), seven PCI (3.3V), one REF (3.3V), one IOAPIC (2.5V or 3.3V), one 48MHz, and one selectable 48_24MHz.

Features

- Generates system clocks for CPU, PCI, IOAPIC, 14.314 MHz, 48 and 24MHz.
- Supports single or dual processor systems
- Skew from CPU (earlier) to PCI clock 1 to 4ns
- Separate 2.5V and 3.3V supply pins
- 2.5V outputs: CPU, IOAPIC
- 3.3V outputs: PCI, REF
- No power supply sequence requirements
- 28 pin SOIC and SSOP
- Spread Spectrum operation optional for PLL1
- CPU frequencies to 100MHz are supported.

Notes:

1. The ICS clock generator is a slave/receiver, I²C component. It can read back the data stored in the latches for verification. **Read-Back will support Intel PIIX4 "Block-Read" protocol.**
2. The data transfer rate supported by this clock generator is 100K bits/sec or less (standard mode)
3. The input is operating at 3.3V logic levels.
4. The data byte format is 8 bit bytes.
5. To simplify the clock generator I²C interface, the protocol is set to use only "**Block-Writes**" from the controller. The bytes must be accessed in sequential order from lowest to highest byte with the ability to stop after any complete byte has been transferred. The Command code and Byte count shown above must be sent, but the data is ignored for those two bytes. The data is loaded until a Stop sequence is issued.
6. At power-on, all registers are set to a default condition, as shown.
