

## Description

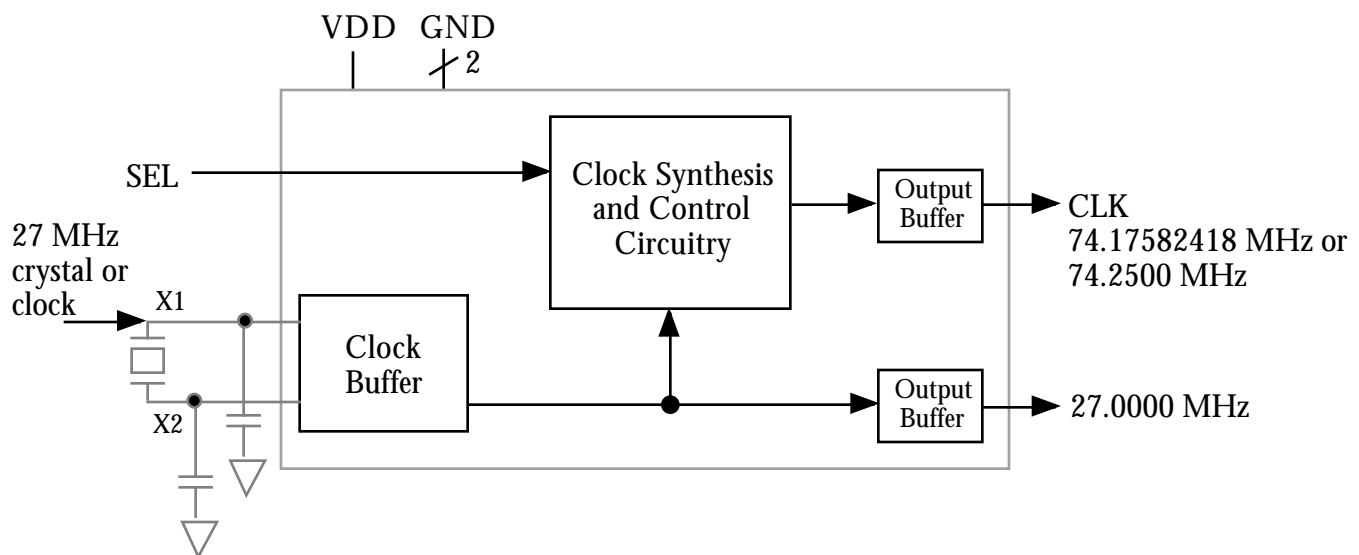

The MK2716 is a low cost, low jitter, high performance clock synthesizer designed to produce the 74.176 MHz and 74.25 MHz clocks necessary for HDTV systems. Using analog Phase-Locked Loop (PLL) techniques, the device accepts a 27 MHz clock or fundamental crystal input. The zero ppm synthesis error exactly locks the display to the digital stream.

MicroClock offers a wide variety of clock synthesizers for desktop and portable computers, and multimedia systems. Consult MicroClock to eliminate crystals and oscillators from your board.

## Features

- Packaged as 8 pin SOIC or die 
- Input frequency of 27 MHz
- Zero ppm synthesis error in output clock
- 3.3 V or 5.0 V $\pm$ 10% operating supply
- 25 mA drive capability at TTL levels
- Ideal for HDTV applications and oscillator manufacturers
- Advanced, low power CMOS process
- Custom masks easily and quickly made

## Pin Descriptions

Number	Name	Type	Description
1	ICLK/X1	XI	Input clock connection. Connect to a 27 MHz clock input or 27 MHz fundamental crystal.
2	VDD	P	Connect to +3.3V or +5V.
3	GND	P	Connect to ground.
4	CLK	O	74.17582418 MHz or 74.25 MHz clock output (see table above).
5	GND	P	Connect to ground.
6	SEL	I	Select pin determines value of CLK per table above.
7	27M	O	27 MHz buffered clock or crystal oscillator output.
8	X2	XO	Connect to 27 MHz crystal, or leave unconnected for clock input.

Type: I = Input; O = output; P = power supply connection; XI, XO = crystal connections

## Decoupling and External Components

The MK2716 requires a 0.1µF decoupling capacitor to be connected between VDD and GND on pins 2 and 3. It must be connected close to the MK2716. Pin 5 can be connected to pin 3. A 33Ω terminating resistor should be placed close to pin 4, and pin 7. If using a crystal input, it should be a 27.00 MHz, parallel resonant, fundamental mode, with load (correlation) capacitance of 18 pF. If the crystal has a load capacitance of 20 pF, connect 4 pF capacitors from X1 and X2 to ground.
