# 16 x 16 PARALLEL CMOS MULTIPLIERS

IDT7216L  
IDT7217L

## FEATURES:

- 16 x 16 parallel multiplier with double precision product
- 16ns clocked multiply time
- Low power consumption: 120mA
- Produced with advanced submicron CMOS high performance technology
- IDT7216L is pin- and function compatible with TRW MPY016H/K and AMD Am29516
- IDT7217L requires a single clock with register enables making it pin- and function compatible with AMD Am29517
- Configured for easy array expansion
- User-controlled option for transparent output register mode
- Round control for rounding the MSP
- Input and output directly TTL-compatible
- Three-state output
- Available in Top Braze, DIP, PLCC, Flatpack and Pin Grid Array
- Military product compliant to MIL-STD-883, Class B
- Standard Military Drawing #5962-86873 is listed on this function for IDT7216 and Standard Military Drawing #5962-87686 is listed for this function for IDT7217.
- Speeds available: Commercial: L16/20/25/35/45/55/65  
Military: L20/25/30/40/55/65/75

## DESCRIPTION:

The IDT7216/IDT7217 are high-speed, low-power 16 x 16-bit multipliers ideal for fast, real time digital signal processing applications. Utilization of a modified Booths algorithm and IDT's high-performance, submicron CMOS technology, has achieved speeds comparable to bipolar (20ns max.), at 1/10 the power consumption.

The IDT7216/IDT7217 are ideal for applications requiring high-speed multiplication such as fast Fourier transform analysis, digital filtering, graphic display systems, speech synthesis and recognition and in any system requirement where multiplication speeds of a mini/microcomputer are inadequate.

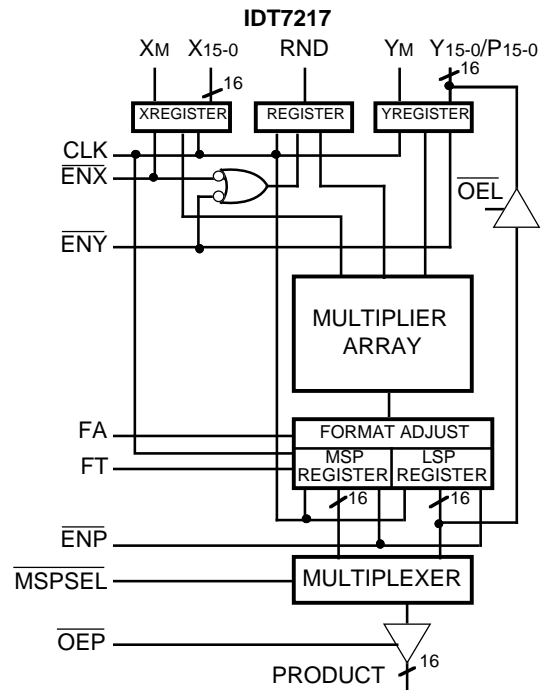

All input registers, as well as LSP and MSP output registers, use the same positive edge-triggered D-type flip-flop. In the IDT7216, there are independent clocks (CLKX, CLKY, CLKM, CLKL) associated with each of these registers. The IDT7217 has only a single clock input (CLK) and three register enables.  $\overline{ENX}$  and  $\overline{ENY}$  control the two input registers, while  $\overline{ENP}$  controls the entire product.

The IDT7216/IDT7217 offer additional flexibility with the FA control and MSPSEL functions. The FA control formats the output for two's complement by shifting the MSP up one bit and then repeating the sign bit in the MSB of the LSP. The

### DESCRIPTION (Cont'd.)

$\overline{\text{MSPSEL}}$  low selects the MSP to be available at the product output port, while a high selects the LSP to be available. Keeping this pin low will ensure compatibility with the TRW MPY016H.

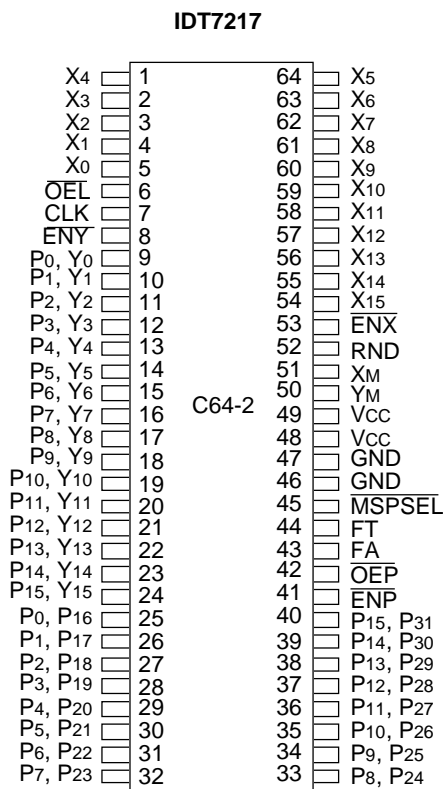

The IDT7216/IDT7217 multipliers are manufactured in compliance with the latest revision of MIL-STD-883, Class B, making them ideally suited to applications demanding the highest level of performance and reliability.

## PIN DESCRIPTIONS

Pin Name	I/O	Description
X <sub>0</sub> - X <sub>15</sub>	I	Data Inputs
Y <sub>0</sub> - Y <sub>15</sub> / P <sub>0</sub> - P <sub>15</sub>	I/O	Y <sub>0</sub> - Y <sub>15</sub> are data inputs P <sub>0</sub> - P <sub>15</sub> are LSP register output, enabled when $\overline{OEL} = 0$
P <sub>16</sub> - P <sub>31</sub>	O	Data Output (LSP or MSP)
$\overline{OEL}$	I	Output enable control for LSP (least significant product). When low enables P <sub>0</sub> - P <sub>15</sub> . When high P <sub>0</sub> - P <sub>15</sub> tristated.
$\overline{OEP}$	I	Output enable control for MSP (most significant product). When low enables P <sub>16</sub> - P <sub>31</sub> . When high P <sub>16</sub> - P <sub>31</sub> tristated.
X <sub>M</sub> , Y <sub>M</sub>	I	Mode control for each data word. Low designates unsigned data input and high designates two's complement.
RND	I	"Round" control for rounding of MSP. When high, 1 is added to the most significant bit of LSP. This signal is affected by the state of FA pin. When FA = 1 and RND = 1, 1 is added to the 2 <sup>-15</sup> bit (P <sub>15</sub> ). When RND = 1 and FA = 0, 1 is added to the 2 <sup>-16</sup> bit (P <sub>14</sub> ). The RND input is registered. It is clocked on the rising edge of the logical OR of CLKX and CLKY in the 7216 and on the rising edge of CLK in the 7217. Rounding always occurs in the positive direction which may introduce a systematic bias.
$\overline{MSPSEL}$	I	When low, MSP is output on P <sub>16</sub> - P <sub>31</sub> lines. When high, LSP is output on P <sub>16</sub> - P <sub>31</sub> .
FA	I	Format adjust control. When high, a full 32 bit product is selected. When low, a left shifted 31 bit product is selected with the sign bit replicated in the LSP. FA is normally high, except for certain fractional two's complement applications (see multiplier input / output formats).
FT	I	Flow through control. When high, both MSP and LSP registers are by-passed.
CLK	I	7217 X, Y, RND, LSP and MSP register clock input.
CLKX	I	7216 X register clock input. Also clocks RND register.
CLKY	I	7216 Y register clock input. Also clocks RND register.
CLKL	I	7216 LSP register clock input.
CLKM	I	7216 MSP register clock input.
$\overline{ENX}$	I	7217 X register clock enable. Also enables RND register clock.
$\overline{ENY}$	I	7217 Y register clock enable. Also enables RND register clock.

## ABSOLUTE MAXIMUM RATINGS<sup>(1)</sup>

Symbol	Rating	Commercial	Military	Unit
V <sub>CC</sub>	Power Supply Voltage	-0.5 to +7.0	-0.5 to +7.0	V
V <sub>TERM</sub>	Terminal Voltage with Respect to GND	V <sub>CC</sub> + 0.5	V <sub>CC</sub> + 0.5	V
T <sub>A</sub>	Operating Temperature	0 to +70	-55 to +125	°C

**NOTE:** <sup>2580 tbl 01</sup>  
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

### NOTES:

1. Typical implies  $V_{CC} = 5V$  and  $T_A = +25^\circ C$ .
2.  $I_{CC}$  is measured at 10MHz and  $V_{IN} = 0$  to 3V. For frequencies greater than 10MHz, the following equation is used for the commercial range:  
 $I_{CC} = 80 + 4(f - 10)\text{mA}$ ; for the military range,  $I_{CC} = 100 + 6(f - 10)$ .  $f$  = operating frequency in MHz,  $f = 1/t_{muc}$  for IDT7216 and  $f = 1/t_{mc}$  for IDT7217.
3. For frequencies greater than 10MHz, guaranteed by design, not production tested.
4.  $I_{OL} = 4\text{mA}$  for  $t_{mc} > 65\text{ns}$ .
