CMOS STATIC RAM 64K (16K x 4-BIT) with Output Control

IDT6198S
IDT6198L

FEATURES:

- High-speed (equal access and cycle times)
 - Military: 20/25/35/45/55/70/85ns (max.)
 - Commercial: 15/20/25/35ns (max.)
- Output Enable (\overline{OE}) pin available for added system flexibility
- Low-power consumption
- JEDEC compatible pinout
- Battery back-up operation—2V data retention (L version only)
- 24-pin Cerdip, high-density 28-pin leadless chip carrier, and 24-pin SOJ
- Produced with advanced CMOS technology
- Bidirectional data inputs and outputs
- Military product compliant to MIL-STD-883, Class B

DESCRIPTION:

The IDT6198 is a 65,536-bit high-speed static RAM organized as 16K x 4. It is fabricated using IDT's high-performance, high-reliability technology—CMOS. This state-of-the-art technology, combined with innovative circuit design techniques,

provides a cost-effective approach for memory intensive applications. Timing parameters have been specified to meet the speed demands of the IDT79R3000 RISC processors.

Access times as fast as 15ns are available. The IDT6198 offers a reduced power standby mode, $ISB1$, which is activated when \overline{CS} goes HIGH. This capability significantly decreases system, while enhancing system reliability. The low-power version (L) also offers a battery backup data retention capability where the circuit typically consumes only 30 μ W when operating from a 2V battery.

All inputs and outputs are TTL-compatible and operate from a single 5V supply.

The IDT6198 is packaged in either a 24-pin 300 mil Cerdip, 28-pin leadless chip carrier or 24-pin J-bend small outline IC.

Military grade product is manufactured in compliance with the latest revision of MIL-STD-883, Class B, making it ideally suited to military temperature applications demanding the highest level of performance and reliability.

TIMING WAVEFORM OF WRITE CYCLE NO. 1 (\overline{WE} CONTROLLED TIMING)^(1, 2, 3, 7)

2987 drw 10

TIMING WAVEFORM OF WRITE CYCLE NO. 2 (\overline{CS} CONTROLLED TIMING)^(1, 2, 3)

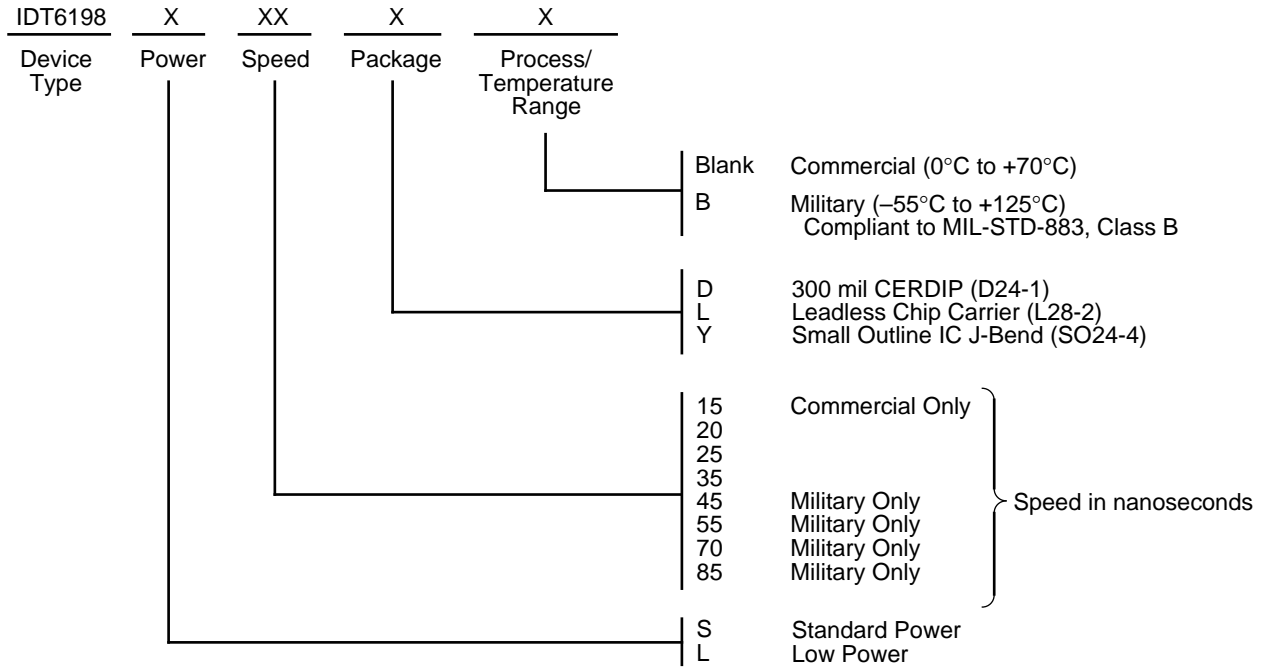

2987 drw 11

NOTES:

1. \overline{WE} or \overline{CS} must be HIGH during all address transitions.
2. A write occurs during the overlap (t_{WP}) of a LOW \overline{CS} and a LOW \overline{WE} .
3. t_{WR} is measured from the earlier of \overline{CS} or \overline{WE} going HIGH to the end of the write cycle.
4. During this period, I/O pins are in the output state so that the input signals must not be applied.
5. If the \overline{CS} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
6. Transition is measured $\pm 200\text{mV}$ from steady state.
7. If \overline{OE} is LOW during a \overline{WE} controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WZ} + t_{DW})$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .
