

3-Pin Microcontroller Power Supply Supervisor

The IMP809/IMP810 are 3.0V, 3.3V and 5.0V power supply supervisor circuits optimized for low-power microprocessor (μP), microcontroller (μC) and digital systems. The IMP809/810 are improved drop-in replacements for the Maxim MAX809/810 and feature 60% lower supply current.

A reset signal is issued if the power supply voltage drops below a preset reset threshold and is asserted for at least 140ms after the supply has risen above the reset threshold. The IMP809 has an active-low RESET output that is guaranteed to be in the correct state for V_{CC} down to 1.1V. The IMP810 has an active-high RESET output. The reset comparator is designed to ignore fast transients on V_{CC} .

Low supply current makes the IMP809/IMP810 ideal for use in portable and battery operated equipment. The IMP809/IMP810 are available in a compact 3-pin SOT23 package.

Six voltage thresholds are available to support 3V to 5V systems:

Reset Threshold	
Suffix	Voltage (V)
L	4.63
M	4.38
J	4.00
T	3.08
S	2.93
R	2.63

Key Features

- ◆ Improved Maxim MAX809/MAX810 replacement
 - Lower supply current...6 μA
 - 80% lower maximum supply current
- ◆ Monitor 5V, 3.3V and 3V supplies
- ◆ 140ms min. reset pulse width
- ◆ Active-low reset valid with 1.1V supply (IMP809)
- ◆ Small 3-pin SOT-23 package
- ◆ No external components
- ◆ Specified over full temperature range
 - -40°C to 105°C

Applications

- ◆ Embedded controllers
- ◆ Battery operated systems
- ◆ Intelligent instruments
- ◆ Wireless communication systems
- ◆ PDAs and handheld equipment

Pin Descriptions

Pin Number	Name	Function
1	GND	Ground
2 (IMP809)	$\overline{\text{RESET}}$	$\overline{\text{RESET}}$ is asserted LOW if V_{CC} falls below the reset threshold and remains LOW for the 240ms typical reset timeout period (140ms minimum) after V_{CC} exceeds the threshold.
2 (IMP810)	RESET	RESET is asserted HIGH if V_{CC} falls below the reset threshold and remains HIGH for the 240ms typical reset timeout period (140ms minimum) after V_{CC} exceeds the threshold.
3	V_{CC}	Power supply input voltage (3.0V, 3.3V, 5.0V)

Detailed Descriptions

Reset Timing

The reset signal is asserted–LOW for the IMP809 and HIGH for the IMP810–when the V_{CC} signal falls below the threshold trip voltage and remains asserted for 140ms minimum after the V_{CC} has risen above the threshold.

Application Information

Negative V_{CC} Transients

The IMP809/810 protect μ P's from brownouts and low V_{CC} . Short duration transients of 100mV amplitude and 20 μ s or less duration typically do not cause a false RESET.

Valid Reset with V_{CC} under 1.1V

To ensure logic inputs connected to the IMP809 $\overline{\text{RESET}}$ pin are in a known state when V_{CC} is under 1.1V, a 100k Ω pull-down

resistor at $\overline{\text{RESET}}$ is needed. The value is not critical. A pull-up resistor to V_{CC} is needed with the IMP810.

Figure 3. RESET Valid with V_{CC} Under 1.1V

Bi-directional Reset Pin Interfacing

The IMP809/810 can interface with μ P/ μ C bi-directional reset pins by connecting a 4.7k Ω resistor in series with the IMP809/810 reset output and the μ P/ μ C bi-directional reset pin.
