ILC1232

mP Supervisory Circuit

POWER POWERED BY IMPALA ON THE GO

General Description

The ILC1232 is a multifunction circuit which monitors microprocessor activity, external reset and power supplies in microprocessor based systems. The circuit functions include a watchdog timer, power supply monitor, microprocessor reset, and manual pushbutton reset input.

The power supply line is monitored with a comparator and an internal voltage reference. $\overline{RST}$ is forced low when an out-of-tolerance condition exists and remains asserted for at least 250ms after V_{CC} rises above the threshold voltage (4.5V or 4.75V). The $\overline{RST}$ pin will remain logic low with V_{CC} as low as 1.4V.

The Watchdog input ($\overline{ST}$) monitors mP activity and will assert $\overline{RST}$ if no mP activity has occurred within the watchdog timeout period. The watchdog timeout period is selectable with nominal periods of 150, 600, or 1200 milliseconds.

Features

- Power OK/Reset Time Delay, 250ms min.
- Watchdog Timer, 150ms, 600ms, or 1.2s typical
- Precision Supply Voltage Monitor, Select Between 5% or 10% of Supply Voltage
- 18µA Supply Current
- Debounced External Reset Input
- 8-Pin SO Package

Applications

- Computers
- Controllers
- Critical Microprocessor Power Monitoring
- Intelligent Instruments
- Portable Equipment

Ordering Information

Part	Package	Temp. Range
ILC1232N	8-Lead PDIP	-40°C to +85°C
ILC1232M	8-Lead SOIC	-40°C to +85°C

Absolute Maximum Ratings

Parameter	Symbol	Ratings	Units
Terminal Voltage	V_{CC}	-0.3 to 6.0	V
	All other inputs	-0.3 to (V_{CC} + 0.3)	V
Input Current	V_{CC}	250	mA
	GND, All other inputs	25	mA
Operating Temperature Range	T_A	-40 to +85	°C
Storage Temperature Range		-65 to +150	°C
Lead Temperature (Soldering, 10 sec.)		300	°C
Power Dissipation		700	mW

Stresses above those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to absolute maximum ratings for extended periods may affect device reliability. Operating ranges define those limits between which the functionality of the device is guaranteed.

Electrical Characterisitcs

V_{CC} = 4.5 V to 5.5 V, T_A = Operating Temperature Range, unless otherwise noted.

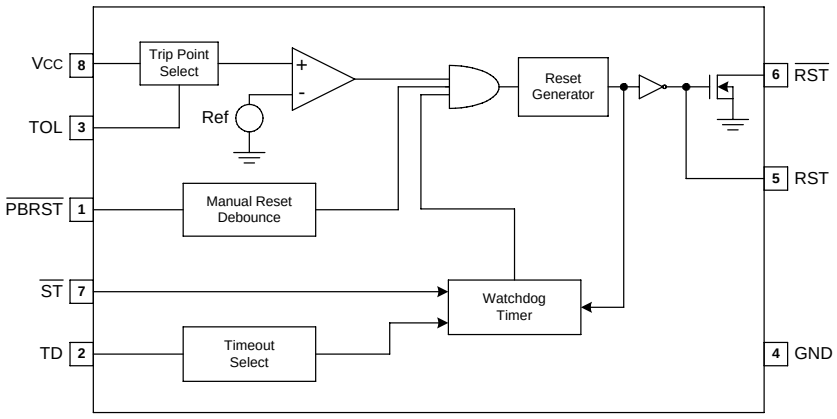
Parameter	Conditions	Min	Typ	Max	Units
Operating Voltage Range, V_{CC}		4.5		5.5	V
Supply Current, I_{CC}	(See Note 1)		18	40	µA
$\overline{ST}$ and $\overline{PBRST}$ Input Levels	V_{IH} (See Note 2) V_{IL}	2.0 -0.3		V_{CC} + 0.3 0.8	V
Input Leakage, I_{IL}				1	µA
Output Source Current, RST	V_{OH} = 2.4V	1.0	10		mA
Output Sink Current, $\overline{RST}$, RST	V_{OL} = 0.4V	2.0	10		mA
V_{CC} 5% Trip Point (Reset Threshold Voltage)	TOL= GND	4.50	4.62	4.74	V
V_{CC} 10% Trip Point (Reset Threshold Voltage)	TOL= V_{CC}	4.25	4.37	4.49	V
Input Capacitance, $\overline{ST}$, TOL	C_{IN} (See Note 3)			5	pF
Output Capacitance, $\overline{RST}$, RST	C_{OUT} (See Note 3)			7	pF
$\overline{PBRST}$ Min. Pulse Width, t_{PB}	$\overline{PBRST}$ = V_{IL} (See Note 4)	20			ms
$\overline{PBRST}$ Delay, t_{PBD}		1	4	20	ms
Reset Active Time, t_{RST}		250	610	1000	ms
$\overline{ST}$ Pulse Width, t_{ST}		20			ns
$\overline{ST}$ Timeout Period, t_{TD}	TD = 0V TD = Open TD = V_{CC}	62.5 250 500	150 600 1200	250 1000 2000	ms
V_{CC} Fall Time, t_F		10			µs
V_{CC} Rise Time, t_R		0			ns
V_{CC} Detect to $\overline{RST}$ Low and RST High, tRPD	V_{CC} Falling at 1.66 mV/µs		50	150	µs
V_{CC} Detect to $\overline{RST}$ Open and RST Low, tRPU	V_{CC} Rising (See Note 5)	250	610	1000	ms

Note 1: I_{CC} is measured with outputs open and inputs within 0.5V of supply rails.
Note 2: $\overline{PBRST}$ has an internal 40kΩ (typical) pull-up resistor to V_{CC}.
Note 3: Guaranteed by design.
Note 4: $\overline{PBRST}$ must be held low for a minimum of 20ms to guarantee a reset.
Note 5: $\overline{RST}$ has an open drain output.

Pin Functions

Pin Number	Pin Name	Description
1	$\overline{\text{PBRST}}$	Pushbutton reset input. This input is debounced and can be driven with external logic signals or a mechanical push button to actively force a reset. All pulses less than 1ms in duration on the $\overline{\text{PBRST}}$ pin are ignored. Any pulse with a duration of 20ms or greater is guaranteed to cause a reset.
2	TD	Time delay input. This input selects the timebase used by the watchdog timer. When TD = 0V, the watchdog timeout period is set to a nominal value of 150ms, when TD = open, the watchdog timeout period is set to a nominal value of 600ms and when TD = V_{CC}, the watchdog timeout period is 1.2 sec nominally.
3	TOL	Tolerance select input. Selects whether 5% or 10% of V_{CC} is used as the reset threshold voltage. When TOL = 0 V, the 5% tolerance level is selected and when TOL = V_{CC}, a 10% tolerance level is selected.
4	GND	Ground pin, 0V reference.
5	RST	RST is asserted high if either V_{CC} goes below the reset threshold, the watchdog times out or $\overline{\text{PBRST}}$ is pulled low for a minimum of 20ms. RST remains asserted for one reset timeout period after V_{CC} exceeds the reset threshold or after the watchdog times out or after $\overline{\text{PBRST}}$ goes high.
6	$\overline{\text{RST}}$	$\overline{\text{RST}}$ is asserted low if either V_{CC} goes below the reset threshold, the watchdog times out or $\overline{\text{PBRST}}$ is pulled low for a minimum of 20ms. $\overline{\text{RST}}$ remains asserted for one reset timeout period after V_{CC} exceeds the reset threshold or after the watchdog times out or after $\overline{\text{PBRST}}$ goes high. Open-drain output.
7	$\overline{\text{ST}}$	Input to the watchdog timer. If $\overline{\text{ST}}$ does not see a transition from high to low within the watchdog timeout period, RST and $\overline{\text{RST}}$ will be asserted.
8	V_{CC}	Power supply input, 5V.

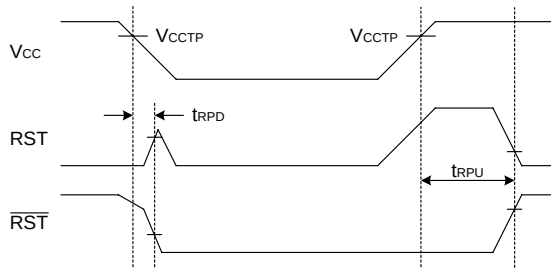
Block Diagram



Circuit Decription

Power Monitor

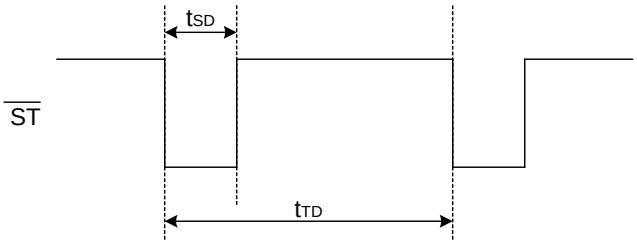
The RST and $\overline{RST}$ pins are asserted whenever V_{CC} falls below the reset threshold voltage set by the TOL pin. A 5% tolerance level (4.62V reset threshold voltage) can be selected by connecting the TOL pin to ground or a 10% tolerance (4.37V reset threshold voltage) can be selected by connecting the TOL pin to V_{CC}. The reset pins will remain asserted for a period of 250ms after V_{CC} has risen above the reset threshold voltage. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure. $\overline{RST}$ will remain valid with V_{CC} as low as 1.4V.



Power-Up/Power-Down Sequence

Watchdog Timer

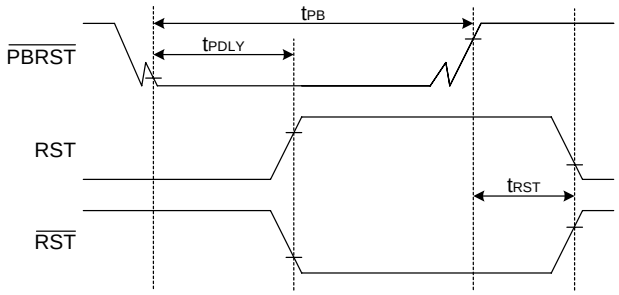
The microprocessor can be monitored by connecting the $\overline{ST}$ pin (watchdog input) to a bus line or I/O line. If a high-to-low transition does not occur on the ST pin within the watchdog timeout period set by the TD pin (see Table 1), the RST and $\overline{RST}$ pins will be asserted resulting in a microprocessor reset. RST and $\overline{RST}$ will remain asserted for 250ms when this occurs. A minimum pulse of 75ns or any transition high-to-low on the $\overline{ST}$ pin will reset the watchdog timer. The watchdog timer will be reset if $\overline{ST}$ sees a valid transition within the watchdog timeout period.



Watchdog Input

Pushbutton Reset Input

The $\overline{PBRST}$ input can be driven with a manual pushbutton switch or with external logic signals. The input is internally debounced and requires an active low signal to force the reset outputs into their active states. The $\overline{PBRST}$ input will recognize any pulse that is 20ms in duration or greater and will ignore all pulses that are less than 1ms in duration.



Pushbutton Reset

TD Pin	t_{TD}		
	Min.	Typ.	Max.
GND	62.5ms	150ms	250ms
Open	250ms	600ms	1000ms
V_{CC}	500ms	1200ms	2000ms
