

PRELIMINARY

80960JD EMBEDDED 32-BIT MICROPROCESSOR

- Pin/Code Compatible with all 80960Jx Processors
- High-Performance Embedded Architecture
 - One Instruction/Clock Execution
 - Core Clock Rate is 2x the Bus Clock
 - Load/Store Programming Model
 - Sixteen 32-Bit Global Registers
 - Sixteen 32-Bit Local Registers (8 sets)
 - Nine Addressing Modes
 - User/Supervisor Protection Model
- Two-Way Set Associative Instruction Cache
 - 80960JD - 4 Kbyte
 - Programmable Cache Locking Mechanism
- Direct Mapped Data Cache
 - 80960JD - 2 Kbyte
 - Write Through Operation
- On-Chip Stack Frame Cache
 - Seven Register Sets Can Be Saved
 - Automatic Allocation on Call/Return
 - 0-7 Frames Reserved for High-Priority Interrupts
- On-Chip Data RAM
 - 1 Kbyte Critical Variable Storage
 - Single-Cycle Access
- High Bandwidth Burst Bus
 - 32-Bit Multiplexed Address/Data
 - Programmable Memory Configuration
 - Selectable 8-, 16-, 32-Bit Bus Widths
 - Supports Unaligned Accesses
 - Big or Little Endian Byte Ordering
- New Instructions
 - Conditional Add, Subtract and Select
 - Processor Management
- High-Speed Interrupt Controller
 - 31 Programmable Priorities
 - Eight Maskable Pins plus NMI
 - Up to 240 Vectors in Expanded Mode
- Two On-Chip Timers
 - Independent 32-Bit Counting
 - Clock Prescaling by 1, 2, 4 or 8
 - Internal Interrupt Sources
- Halt Mode for Low Power
- IEEE 1149.1 (JTAG) Boundary Scan Compatibility
- Packages
 - 132-Lead Pin Grid Array (PGA)
 - 132-Lead Plastic Quad Flat Pack (PQFP)

1.0 PURPOSE

This document contains advance information for the 80960JD microprocessor, including electrical characteristics and package pinout information. Detailed functional descriptions — other than parametric performance — are published in the *i960® Jx Microprocessor User's Guide (272483)*.

Throughout this data sheet, references to “80960Jx” indicate features which apply to all of the following:

- 80960JA — 5V, 2 Kbyte instruction cache, 1 Kbyte data cache
- 80960JF — 5V, 4 Kbyte instruction cache, 2 Kbyte data cache
- 80960JD — 5V, 4 Kbyte instruction cache, 2 Kbyte data cache and clock doubling
- 80L960JA — 3.3 V version of the 80960JA
- 80L960JF — 3.3 V version of the 80960JF

2.0 80960JD OVERVIEW

The 80960JD offers high performance to cost-sensitive 32-bit embedded applications. The 80960JD is object code compatible with the 80960 Core Architecture and is capable of sustained execution at the rate of one instruction per clock. This processor's features include generous instruction cache, data cache and data RAM. It also boasts a fast interrupt mechanism, dual programmable timer units and new instructions.

The 80960JD's clock doubler operates the processor core at twice the bus clock rate to improve execution performance without increasing the complexity of board designs.

Memory subsystems for cost-sensitive embedded applications often impose substantial wait state penalties. The 80960JD integrates considerable storage resources on-chip to decouple CPU execution from the external bus.

The 80960JD rapidly allocates and deallocates local register sets during context switches. The processor needs to flush a register set to the stack only when it saves more than seven sets to its local register cache.

A 32-bit multiplexed burst bus provides a high-speed interface to system memory and I/O. A full complement of control signals simplifies the connection of the 80960JD to external components. The user programs physical and logical memory

attributes through memory-mapped control registers (MMRs) — an extension not found on the i960 Kx, Sx or Cx processors. Physical and logical configuration registers enable the processor to operate with all combinations of bus width and data object alignment. The processor supports a homogeneous byte ordering model.

This processor integrates two important peripherals: a timer unit and an interrupt controller. These and other hardware resources are programmed through memory-mapped control registers, an extension to the familiar 80960 architecture.

The timer unit (TU) offers two independent 32-bit timers for use as real-time system clocks and general-purpose system timing. These operate in either single-shot or auto-reload mode and can generate interrupts.

The interrupt controller unit (ICU) provides a flexible means for requesting interrupts. The ICU provides full programmability of up to 240 interrupt sources into 31 priority levels. The ICU takes advantage of a cached priority table and optional routine caching to minimize interrupt latency. Clock doubling reduces interrupt latency by 40% compared to the 80960JA/JF. Local registers may be dedicated to high-priority interrupts to further reduce latency. Acting independently from the core, the ICU compares the priorities of posted interrupts with the current process priority, off-loading this task from the core. The ICU also supports the integrated timer interrupts.

The 80960JD features a Halt mode designed to support applications where low power consumption is critical. The **halt** instruction shuts down instruction execution, resulting in a power savings of up to 90 percent.

The 80960JD's testability features, including ONCE (On-Circuit Emulation) mode and Boundary Scan (JTAG), provide a powerful environment for design debug and fault diagnosis.

The *Solutions960®* program features a wide variety of development tools which support the i960 processor family. Many of these tools are developed by partner companies; some are developed by Intel, such as profile-driven optimizing compilers. For more information on these products, contact your local Intel representative.

Figure 2. 80960JD Block Diagram

2.1 80960 Processor Core

The 80960Jx family is a scalar implementation of the 80960 Core Architecture. Intel designed this processor core as a very high performance device that is also cost-effective. Factors that contribute to the core's performance include:

- Core operates at twice the bus speed (80960JD only)
- Single-clock execution of most instructions
- Independent Multiply/Divide Unit
- Efficient instruction pipeline minimizes pipeline break latency
- Register and resource scoreboarding allow overlapped instruction execution

- 128-bit register bus speeds local register caching
- 4 Kbyte two-way set associative, integrated instruction cache
- 2 Kbyte direct-mapped, integrated data cache
- 1 Kbyte integrated data RAM delivers zero wait state program data

2.2 Burst Bus

A 32-bit high-performance bus controller interfaces the 80960JD to external memory and peripherals. The BCU fetches instructions and transfers data at the rate of up to four 32-bit words per six clock cycles. The external address/data bus is multiplexed.

Users may configure the 80960JD's bus controller to match an application's fundamental memory organization. Physical bus width is register-programmed for up to eight regions. Byte ordering and data caching are programmed through a group of logical memory templates and a defaults register.

The BCU's features include:

- Multiplexed external bus to minimize pin count
- 32-, 16- and 8-bit bus widths to simplify I/O interfaces
- External ready control for address-to-data, data-to-data and data-to-next-address wait state types
- Support for big or little endian byte ordering to facilitate the porting of existing program code
- Unaligned bus accesses performed transparently
- Three-deep load/store queue to decouple the bus from the core

Upon reset, the 80960JD conducts an internal self test. Then, before executing its first instruction, it performs an external bus confidence test by performing a checksum on the first words of the initialization boot record (IBR).

The user may examine the contents of the caches at any time by executing special cache control instructions.

2.3 Timer Unit

The timer unit (TU) contains two independent 32-bit timers which are capable of counting at several clock rates and generating interrupts. Each is programmed by use of the TU registers. These memory-mapped registers are addressable on 32-bit boundaries. The timers have a single-shot mode and auto-reload capabilities for continuous operation. Each timer has an independent interrupt request to the 80960JD's interrupt controller. The TU can generate a fault when unauthorized writes from user mode are detected. Clock prescaling is supported.

2.4 Priority Interrupt Controller

A programmable interrupt controller manages up to 240 external sources through an 8-bit external interrupt port. Alternatively, the interrupt inputs may be configured for individual edge- or level-triggered

inputs. The interrupt unit (IU) also accepts interrupts from the two on-chip timer channels and a single Non-Maskable Interrupt (NMI) pin. Interrupts are serviced according to their priority levels relative to the current process priority.

Low interrupt latency is critical to many embedded applications. As part of its highly flexible interrupt mechanism, the 80960JD exploits several techniques to minimize latency:

- Interrupt vectors and interrupt handler routines can be reserved on-chip
- Register frames for high-priority interrupt handlers can be cached on-chip
- The interrupt stack can be placed in cacheable memory space
- Interrupt microcode executes at twice the bus frequency

2.5 Instruction Set Summary

The 80960Jx adds several new instructions to the i960 core architecture. The new instructions are:

- Conditional Move
- Conditional Add
- Conditional Subtract
- Byte Swap
- Halt
- Cache Control
- Interrupt Control

Table 1 identifies the instructions that the 80960Jx supports. Refer to *i960[®] Jx Microprocessor User's Guide (272483)* for a detailed description of each instruction.

2.6 Faults and Debugging

The 80960Jx employs a comprehensive fault model. The processor responds to faults by making implicit calls to a fault handling routine. Specific information collected for each fault allows the fault handler to diagnose exceptions and recover appropriately.

The processor also has built-in debug capabilities. In software, the 80960Jx may be configured to detect as many as seven different trace event types. Alter-

natively, **mark** and **fmark** instructions can generate trace events explicitly in the instruction stream. Hardware breakpoint registers are also available to trap on execution and data addresses.

2.7 Low Power Operation

Intel fabricates the 80960Jx using an advanced sub-micron manufacturing process. The processor's sub-micron topology provides the circuit density for optimal cache size and high operating speeds while dissipating modest power. The processor also uses dynamic power management to turn off clocks to unused circuits.

Users may program the 80960Jx to enter Halt mode for maximum power savings. In Halt mode, the processor core stops completely while the integrated peripherals continue to function, reducing overall power requirements up to 90 percent. Processor execution resumes from internally or externally generated interrupts.

2.8 Test Features

The 80960Jx incorporates numerous features which enhance the user's ability to test both the processor and the system to which it is attached. These features include ONCE (On-Circuit Emulation) mode and Boundary Scan (JTAG).

The 80960Jx provides testability features compatible with IEEE Standard Test Access Port and Boundary Scan Architecture (IEEE Std. 1149.1).

One of the boundary scan instructions, HIGHZ, forces the processor to float all its output pins (ONCE mode). ONCE mode can also be initiated at reset without using the boundary scan mechanism.

ONCE mode is useful for board-level testing. This feature allows a mounted 80960JD to electrically "remove" itself from a circuit board. This allows for system-level testing where a remote tester — such as an in-circuit emulator — can exercise the processor system.

The provided test logic does not interfere with component or circuit board behavior and ensures that components function correctly, connections

between various components are correct, and various components interact correctly on the printed circuit board.

The JTAG Boundary Scan feature is an attractive alternative to conventional "bed-of-nails" testing. It can examine connections which might otherwise be inaccessible to a test system.

2.9 Memory-Mapped Control Registers

The 80960JD, though compliant with i960 series processor core, has the added advantage of memory-mapped, internal control registers not found on the i960 Kx, Sx or Cx processors. These give software the interface to easily read and modify internal control registers.

Each of these registers is accessed as a memory-mapped, 32-bit register. Access is accomplished through regular memory-format instructions. The processor ensures that these accesses do not generate external bus cycles.

2.10 Data Types and Memory Addressing Modes

As with all i960 family processors, the 80960Jx instruction set supports several data types and formats:

- Bit
- Bit fields
- Integer (8-, 16-, 32-, 64-bit)
- Ordinal (8-, 16-, 32-, 64-bit unsigned integers)
- Triple word (96 bits)
- Quad word (128 bits)

The 80960Jx provides a full set of addressing modes for C and assembly programming:

- Two Absolute modes
- Five Register Indirect modes
- Index with displacement
- IP with displacement

Table 1. 80960Jx Instruction Set

Data Movement	Arithmetic	Logical	Bit, Bit Field and Byte
Load Store Move *Conditional Select Load Address	Add Subtract Multiply Divide Remainder Modulo Shift Extended Shift Extended Multiply Extended Divide Add with Carry Subtract with Carry *Conditional Add *Conditional Subtract Rotate	And Not And And Not Or Exclusive Or Not Or Or Not Nor Exclusive Nor Not Nand	Set Bit Clear Bit Not Bit Alter Bit Scan For Bit Span Over Bit Extract Modify Scan Byte for Equal *Byte Swap

NOTE: Asterisk (*) denotes new 80960Jx instructions unavailable on 80960CA/CF, 80960KA/KB and 80960SA/SB implementations.

3.0 PACKAGE INFORMATION

The 80960JD is offered in several speed and package types. The 132-pin Pin Grid Array (PGA) device will be specified for operation at $V_{CC} = 5.0\text{ V} \pm 5\%$ over a case temperature range of 0° to 85°C :

- A80960JD-50 (50 MHz core, 25 MHz bus)

The 132-pin Pin Grid Array (PGA) device will be specified for operation at $V_{CC} = 5.0\text{ V} \pm 5\%$ over a case temperature range of 0° to 100°C :

- A80960JD-40 (40 MHz core, 20 MHz bus)
- A80960JD-33 (33.33 MHz core, 16.67 MHz bus)

The 132-pin Plastic Quad Flatpack (PQFP) devices will be specified for operation at $V_{CC} = 5.0\text{ V} \pm 5\%$ over a case temperature range of 0° to 100°C :

- NG80960JD-40 (40 MHz core, 20 MHz bus)
- NG80960JD-33 (33.33 MHz core, 16.67 MHz bus)

For complete package specifications and information, refer to Intel's Packaging Handbook (240800).

3.1 Pin Descriptions

This section describes the pins for the 80960JD in the 132-pin ceramic Pin Grid Array (PGA) package and 132-lead Plastic Quad Flatpack Package (PQFP).

Section 3.1.1, Functional Pin Definitions describes pin function; **Section 3.1.2, 80960Jx 132-Lead PGA Pinout** and **Section 3.1.3, 80960Jx PQFP Pinout** define the signal and pin locations for the supported package types.

3.1.1 Functional Pin Definitions

Table 2 presents the legend for interpreting the pin descriptions which follow. Pins associated with the bus interface are described in Table 3. Pins associated with basic control and test functions are described in Table 4. Pins associated with the Interrupt Unit are described in Table 5.

Table 2. Pin Description Nomenclature

Symbol	Description
I	Input pin only.
O	Output pin only.
I/O	Pin can be either an input or output.
–	Pin must be connected as described.
S	Synchronous. Inputs must meet setup and hold times relative to CLKIN for proper operation. S(E) Edge sensitive input S(L) Level sensitive input
A (...)	Asynchronous. Inputs may be asynchronous relative to CLKIN. A(E) Edge sensitive input A(L) Level sensitive input
R (...)	While the processor's $\overline{\text{RESET}}$ pin is asserted, the pin: R(1) is driven to V_{CC} R(0) is driven to V_{SS} R(Q) is a valid output R(X) is driven to unknown state R(H) is pulled up to V_{CC}
H (...)	While the processor is in the hold state, the pin: H(1) is driven to V_{CC} H(0) is driven to V_{SS} H(Q) Maintains previous state or continues to be a valid output H(Z) Floats
P (...)	While the processor is halted, the pin: P(1) is driven to V_{CC} P(0) is driven to V_{SS} P(Q) Maintains previous state or continues to be a valid output

Table 3. Pin Description — External Bus Signals (Sheet 1 of 4)

NAME	TYPE	DESCRIPTION															
AD31:0	I/O S(L) R(X) H(Z) P(Q)	<p>ADDRESS / DATA BUS carries 32-bit physical addresses and 8-, 16- or 32-bit data to and from memory. During an address (T_a) cycle, bits 31:2 contain a physical word address (bits 0-1 indicate SIZE; see below). During a data (T_d) cycle, read or write data is present on one or more contiguous bytes, comprising AD31:24, AD23:16, AD15:8 and AD7:0. During write operations, unused pins are driven to determinate values.</p> <p>SIZE, which comprises bits 0-1 of the AD lines during a T_a cycle, specifies the number of data transfers during the bus transaction.</p> <table border="1"> <thead> <tr> <th>AD1</th> <th>AD0</th> <th>Bus Transfers</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>1 Transfer</td> </tr> <tr> <td>0</td> <td>1</td> <td>2 Transfers</td> </tr> <tr> <td>1</td> <td>0</td> <td>3 Transfers</td> </tr> <tr> <td>1</td> <td>1</td> <td>4 Transfers</td> </tr> </tbody> </table> <p>When the processor enters Halt mode, if the previous bus operation was a:</p> <ul style="list-style-type: none"> • write — AD31:2 are driven with the last data value on the AD bus. • read — AD31:4 are driven with the last address value on the AD bus; AD3:2 are driven with the value of A3:2 from the last data cycle. <p>Typically, AD1:0 reflect the SIZE information of the last bus transaction (either instruction fetch or load/store) that was executed before entering Halt mode.</p>	AD1	AD0	Bus Transfers	0	0	1 Transfer	0	1	2 Transfers	1	0	3 Transfers	1	1	4 Transfers
AD1	AD0	Bus Transfers															
0	0	1 Transfer															
0	1	2 Transfers															
1	0	3 Transfers															
1	1	4 Transfers															
ALE	O R(0) H(Z) P(0)	<p>ADDRESS LATCH ENABLE indicates the transfer of a physical address. ALE is asserted during a T_a cycle and deasserted before the beginning of the T_d state. It is active HIGH and floats to a high impedance state during a hold cycle (T_H).</p>															
ALE	O R(1) H(Z) P(1)	<p>ADDRESS LATCH ENABLE indicates the transfer of a physical address. $\overline{\text{ALE}}$ is the inverted version of ALE. This signal gives the 80960JD a high degree of compatibility with existing 80960Kx systems.</p>															
ADS	O R(1) H(Z) P(1)	<p>ADDRESS STROBE indicates a valid address and the start of a new bus access. The processor asserts ADS for the entire T_a cycle. External bus control logic typically samples ADS at the end of the cycle.</p>															
A3:2	O R(X) H(Z) P(Q)	<p>ADDRESS3:2 comprise a partial demultiplexed address bus.</p> <p><i>32-bit memory accesses:</i> the processor asserts address bits A3:2 during T_a. The partial word address increments with each assertion of RDYRCV during a burst.</p> <p><i>16-bit memory accesses:</i> the processor asserts address bits A3:1 during T_a with A1 driven on the $\overline{\text{BE}}1$ pin. The partial short word address increments with each assertion of RDYRCV during a burst.</p> <p><i>8-bit memory accesses:</i> the processor asserts address bits A3:0 during T_a, with A1:0 driven on $\overline{\text{BE}}1:0$. The partial byte address increments with each assertion of RDYRCV during a burst.</p>															

Table 3. Pin Description — External Bus Signals (Sheet 2 of 4)

NAME	TYPE	DESCRIPTION															
$\overline{\text{BE}}3:0$	O R(1) H(Z) P(1)	<p>BYTE ENABLES select which of up to four data bytes on the bus participate in the current bus access. Byte enable encoding is dependent on the bus width of the memory region accessed:</p> <p><i>32-bit bus:</i></p> <p>$\overline{\text{BE}}3$ enables data on AD31:24 $\overline{\text{BE}}2$ enables data on AD23:16 $\overline{\text{BE}}1$ enables data on AD15:8 $\overline{\text{BE}}0$ enables data on AD7:0</p> <p><i>16-bit bus:</i></p> <p>$\overline{\text{BE}}3$ becomes Byte High Enable (enables data on AD15:8) $\overline{\text{BE}}2$ is not used (state is high) $\overline{\text{BE}}1$ becomes Address Bit 1 (A1) $\overline{\text{BE}}0$ becomes Byte Low Enable (enables data on AD7:0)</p> <p><i>8-bit bus:</i></p> <p>$\overline{\text{BE}}3$ is not used (state is high) $\overline{\text{BE}}2$ is not used (state is high) $\overline{\text{BE}}1$ becomes Address Bit 1 (A1) $\overline{\text{BE}}0$ becomes Address Bit 0 (A0)</p> <p>The processor asserts byte enables, byte high enable and byte low enable during T_a. Since unaligned bus requests are split into separate bus transactions, these signals do not toggle during a burst. They remain active through the last T_d cycle.</p> <p>For accesses to 8- and 16-bit memory, the processor asserts the address bits in conjunction with A3:2 described above.</p>															
WIDTH/ HLTD1:0	O R(0) H(Z) P(1)	<p>WIDTH/HALTED signals denote the physical memory attributes for a bus transaction:</p> <table border="1"> <thead> <tr> <th>WIDTH/HLTD1</th> <th>WIDTH/HLTD0</th> <th></th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>8 Bits Wide</td> </tr> <tr> <td>0</td> <td>1</td> <td>16 Bits Wide</td> </tr> <tr> <td>1</td> <td>0</td> <td>32 Bits Wide</td> </tr> <tr> <td>1</td> <td>1</td> <td>Processor Halted</td> </tr> </tbody> </table> <p>The processor floats the WIDTH/HLTD pins whenever it relinquishes the bus in response to a HOLD request, regardless of prior operating state.</p>	WIDTH/HLTD1	WIDTH/HLTD0		0	0	8 Bits Wide	0	1	16 Bits Wide	1	0	32 Bits Wide	1	1	Processor Halted

0	1	16 Bits Wide															
1	0	32 Bits Wide															
1	1	Processor Halted															
$\overline{\text{D/C}}$	O R(X) H(Z) P(Q)	<p>DATA/CODE indicates that a bus access is a data access (1) or an instruction access (0). $\overline{\text{D/C}}$ has the same timing as W/R.</p> <p>0 = instruction access 1 = data access</p>															
$\overline{\text{W/R}}$	O R(0) H(Z) P(Q)	<p>WRITE/READ specifies, during a T_a cycle, whether the operation is a write (1) or read (0). It is latched on-chip and remains valid during T_d cycles.</p> <p>0 = read 1 = write</p>															

Table 3. Pin Description — External Bus Signals (Sheet 3 of 4)

NAME	TYPE	DESCRIPTION
DT/R	O R(0) H(Z) P(Q)	DATA TRANSMIT / RECEIVE indicates the direction of data transfer to and from the address/data bus. It is low during T_a and T_w/T_d cycles for a read; it is high during T_a and T_w/T_d cycles for a write. DT/R never changes state when \overline{DEN} is asserted. 0 = receive 1 = transmit
DEN	O R(1) H(Z) P(1)	DATA ENABLE indicates data transfer cycles during a bus access. \overline{DEN} is asserted at the start of the first data cycle in a bus access and deasserted at the end of the last data cycle. \overline{DEN} is used with DT/R to provide control for data transceivers connected to the data bus. 0 = data cycle 1 = not data cycle
BLAST	O R(1) H(Z) P(1)	BURST LAST indicates the last transfer in a bus access. \overline{BLAST} is asserted in the last data transfer of burst and non-burst accesses. \overline{BLAST} remains active as long as wait states are inserted via the RDYRCV pin. \overline{BLAST} becomes inactive after the final data transfer in a bus cycle. 0 = last data transfer 1 = not last data transfer
RDYRCV	I S(L)	READY/RECOVER indicates that data on AD lines can be sampled or removed. If RDYRCV is not asserted during a T_d cycle, the T_d cycle is extended to the next cycle by inserting a wait state (T_w). 0 = sample data 1 = don't sample data The \overline{RDYRCV} pin has another function during the recovery (T_r) state. The processor continues to insert additional recovery states until it samples the pin HIGH. This function gives slow external devices more time to float their buffers before the processor begins to drive address again. 0 = insert wait states 1 = recovery complete
LOCK/ ONCE	I/O S(L) R(H) H(Z) P(1)	BUS LOCK indicates that an atomic read-modify-write operation is in progress. The \overline{LOCK} output is asserted in the first clock of an atomic operation and deasserted in the last data transfer of the sequence. The processor does not grant HOLDA while it is asserting \overline{LOCK} . This prevents external agents from accessing memory involved in semaphore operations. 0 = Atomic read-modify-write in progress 1 = Atomic read-modify-write not in progress ONCE MODE: The processor samples the \overline{ONCE} input during reset. If it is asserted LOW at the end of reset, the processor enters ONCE mode. In ONCE mode, the processor stops all clocks and floats all output pins. The pin has a weak internal pullup which is active during reset to ensure normal operation when the pin is left unconnected. 0 = ONCE mode enabled 1 = ONCE mode not enabled

Table 3. Pin Description — External Bus Signals (Sheet 4 of 4)

NAME	TYPE	DESCRIPTION
HOLD	I S(L)	HOLD: A request from an external bus master to acquire the bus. When the processor receives HOLD and grants bus control to another master, it asserts HOLDA, floats the address/data and control lines and enters the T_h state. When HOLD is deasserted, the processor deasserts HOLDA and enters either the T_1 or T_a state, resuming control of the address/data and control lines. 0 = no hold request 1 = hold request
HOLDA	O R(Q) H(1) P(Q)	HOLD ACKNOWLEDGE indicates to an external bus master that the processor has relinquished control of the bus. The processor can grant HOLD requests and enter the T_h state during reset and while halted as well as during regular operation. 0 = hold not acknowledged 1 = hold acknowledged
BSTAT	O R(0) H(Q) P(0)	BUS STATUS indicates that the processor may soon stall unless it has sufficient access to the bus; see <i>i960[®] Jx Microprocessor User's Guide (272483)</i> . Arbitration logic can examine this signal to determine when an external bus master should acquire/relinquish the bus. 0 = no potential stall 1 = potential stall

Table 4. Pin Description — Processor Control Signals, Test Signals and Power (Sheet 1 of 2)

NAME	TYPE	DESCRIPTION
CLKIN	I	CLOCK INPUT provides the processor's fundamental time base; both the processor core and the external bus run at the CLKIN rate. All input and output timings are specified relative to a rising CLKIN edge.
RESET	I A(L)	RESET initializes the processor and clears its internal logic. During reset, the processor places the address/data bus and control output pins in their idle (inactive) states. During reset, the input pins are ignored with the exception of $\overline{\text{LOCK/ONCE}}$, STEST and HOLD. The $\overline{\text{RESET}}$ pin has an internal synchronizer. To ensure predictable processor initialization during power up, $\overline{\text{RESET}}$ must be asserted a minimum of 10,000 CLKIN cycles with V_{CC} and CLKIN stable. On a warm reset, $\overline{\text{RESET}}$ should be asserted for a minimum of 15 cycles.
STEST	I S(L)	SELF TEST enables or disables the processor's internal self-test feature at initialization. STEST is examined at the end of reset. When STEST is asserted, the processor performs its internal self-test and the external bus confidence test. When STEST is deasserted, the processor performs only the external bus confidence test. 0 = self test disabled 1 = self test enabled

Table 4. Pin Description — Processor Control Signals, Test Signals and Power (Sheet 2 of 2)

NAME	TYPE	DESCRIPTION
$\overline{\text{FAIL}}$	O R(0) H(Q) P(1)	<p>FAIL indicates a failure of the processor's built-in self-test performed during initialization. FAIL is asserted immediately upon reset and toggles during self-test to indicate the status of individual tests:</p> <ul style="list-style-type: none"> When self-test passes, the processor deasserts $\overline{\text{FAIL}}$ and begins operation from user code. When self-test fails, the processor asserts $\overline{\text{FAIL}}$ and then stops executing. <p>0 = self test failed 1 = self test passed</p>
TCK	I	<p>TEST CLOCK is a CPU input which provides the clocking function for IEEE 1149.1 Boundary Scan Testing (JTAG). State information and data are clocked into the processor on the rising edge; data is clocked out of the processor on the falling edge.</p>
TDI	I S(L)	<p>TEST DATA INPUT is the serial input pin for JTAG. TDI is sampled on the rising edge of TCK, during the SHIFT-IR and SHIFT-DR states of the Test Access Port.</p>
TDO	O R(Q) H(Q) P(Q)	<p>TEST DATA OUTPUT is the serial output pin for JTAG. TDO is driven on the falling edge of TCK during the SHIFT-IR and SHIFT-DR states of the Test Access Port. At other times, TDO floats. TDO does not float during ONCE mode.</p>
$\overline{\text{TRST}}$	I A(L)	<p>TEST RESET asynchronously resets the Test Access Port (TAP) controller function of IEEE 1149.1 Boundary Scan testing (JTAG). When using the Boundary Scan feature, connect a pull-down resistor between this pin and V_{SS}. If TAP is not used, this pin must be connected to V_{SS}; however, no resistor is required. See Section 4.3, Connection Recommendations (pg. 24).</p>
TMS	I S(L)	<p>TEST MODE SELECT is sampled at the rising edge of TCK to select the operation of the test logic for IEEE 1149.1 Boundary Scan testing.</p>
V_{CC}	–	<p>POWER pins intended for external connection to a V_{CC} board plane.</p>
V_{CCPLL}	–	<p>PLL POWER is a separate V_{CC} supply pin for the phase lock loop clock generator. It is intended for external connection to the V_{CC} board plane. In noisy environments, add a simple bypass filter circuit to reduce noise-induced clock jitter and its effects on timing relationships.</p>
V_{SS}	–	<p>GROUND pins intended for external connection to a V_{SS} board plane.</p>
NC	–	<p>NO CONNECT pins. Do not make any system connections to these pins.</p>

Table 5. Pin Description — Interrupt Unit Signals

NAME	TYPE	DESCRIPTION
XINT7:0	I A(E/L)	<p>EXTERNAL INTERRUPT pins are used to request interrupt service. The XINT7:0 pins can be configured in three modes:</p> <p>Dedicated Mode: Each pin is assigned a dedicated interrupt level. Dedicated inputs can be programmed to be level (low) or edge (falling) sensitive.</p> <p>Expanded Mode: All eight pins act as a vectored interrupt source. The interrupt pins are level sensitive in this mode.</p> <p>Mixed Mode: The XINT7:5 pins act as dedicated sources and the XINT4:0 pins act as the five most significant bits of a vectored source. The least significant bits of the vectored source are set to 010₂ internally.</p> <p>Unused external interrupt pins should be connected to V_{CC}.</p>
NMI	I A(E)	<p>NON-MASKABLE INTERRUPT causes a non-maskable interrupt event to occur. NMI is the highest priority interrupt source and is falling edge-triggered. If NMI is unused, it should be connected to V_{CC}.</p>

3.2 Package Thermal Specifications

The 80960JD is specified for operation when T_C (case temperature) is within the range of 0°C to 85°C for the (PGA) 80960JD-50, or 0°C to 100°C for the (PQFP and PGA) 80960JD-40 and 80960JD-33. Case temperature may be measured in any environment to determine whether the 80960JD is within specified operating range. The case temperature should be measured at the center of the top surface, opposite the pins.

θ_{CA} is the thermal resistance from case to ambient. Use the following equation to calculate T_A , the maximum ambient temperature to conform to a particular case temperature:

$$T_A = T_C - P (\theta_{CA})$$

Junction temperature (T_J) is commonly used in reliability calculations. T_J can be calculated from θ_{JC} (thermal resistance from junction to case) using the following equation:

$$T_J = T_C + P (\theta_{JC})$$

Similarly, if T_A is known, the corresponding case temperature (T_C) can be calculated as follows:

$$T_C = T_A + P (\theta_{CA})$$

Compute P by multiplying I_{CC} from Table 14 and V_{CC} . Values for θ_{JC} and θ_{CA} are given in Table 10 for the PGA package and Table 11 for the PQFP package. For high speed operation, the processor's θ_{JA} may be significantly reduced by adding a heatsink and/or by increasing airflow.

Figure 6 shows the maximum ambient temperature (T_A) permitted without exceeding T_C for the 80960JD-50 in a PGA package. Figure 7 illustrates this for the 80960JD-40 in PGA and PQFP packages. The curves are based on minimum I_{CC} (hot) and maximum V_{CC} of +5.25 V, with a T_{CASE} of +85°C for the 80960JD-50, or a T_{CASE} of +100°C for the 80960JD-40.

Table 10. 132-Lead PGA Package Thermal Characteristics

Thermal Resistance — °C/Watt						
Parameter	Airflow — ft./min (m/sec)					
	0 (0)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)	1000 (5.08)
θ_{JC} (Junction-to-Case)	3	3	3	3	3	3
θ_{CA} (Case-to-Ambient) (No Heatsink)	18	15	12	11	11	11
θ_{CA} (Case-to-Ambient) (Omnidirectional Heatsink)	15	12	9	8	8	8
θ_{CA} (Case-to-Ambient) (Unidirectional Heatsink)	14	11	8	7	7	7

NOTES:

1. This table applies to a PGA device plugged into a socket or soldered directly into a board.
2. $\theta_{JA} = \theta_{JC} + \theta_{CA}$
3. $\theta_{J-CAP} = 4^\circ\text{C/W}$ (approx.)
4. $\theta_{J-PIN} = 4^\circ\text{C/W}$ (inner pins) (approx.)
5. $\theta_{J-PIN} = 8^\circ\text{C/W}$ (outer pins) (approx.)

Table 11. 132-Lead PQFP Package Thermal Characteristics

Thermal Resistance — °C/Watt							
Parameter	Airflow — ft./min (m/sec)						
	0 (0)	50 (0.25)	100 (0.50)	200 (1.01)	400 (2.03)	600 (3.04)	800 (4.06)
θ_{JC} (Junction-to-Case)	6	7	7	7	7	7	7
θ_{CA} (Case-to-Ambient -No Heatsink)	23	20	18	14	10	9	8

NOTES:

1. This table applies to a PQFP device soldered directly into board.
2. $\theta_{JA} = \theta_{JC} + \theta_{CA}$
3. $\theta_{JL} = 18^{\circ}\text{C/W}$ (approx.)
4. $\theta_{JB} = 18^{\circ}\text{C/W}$ (approx.)

One Kool Path
Laconia, NH 03247-0400
(603) 528-3400

4.0 ELECTRICAL SPECIFICATIONS

4.1 Absolute Maximum Ratings

Parameter	Maximum Rating
Storage Temperature	-65° C to +150° C
Case Temperature Under Bias	-65° C to +110° C
Supply Voltage wrt. V_{SS}	-0.5V to + 4.6V
Voltage on Other Pins wrt. V_{SS}	-0.5V to $V_{CC} + 0.5V$

NOTICE: This data sheet contains preliminary information on new products in production. The specifications are subject to change without notice.

WARNING: *Stressing the device beyond the “Absolute Maximum Ratings” may cause permanent damage. These are stress ratings only. Operation beyond the “Operating Conditions” is not recommended and extended exposure beyond the “Operating Conditions” may affect device reliability.*

4.2 Operating Conditions

Table 12. 80960JD Operating Conditions

Symbol	Parameter	Min	Max	Units	Notes
V_{CC}	Supply Voltage			V	
	80960JD-50	4.75	5.25		
	80960JD-40	4.75	5.25		
	80960JD-33	4.75	5.25		
f_{CLKIN}	Input Clock Frequency			MHz	
	80960JD-50	8	25		
	80960JD-40	8	20		
	80960JD-33	8	16.67		
T_C	Operating Case Temperature			°C	
	A80960JD-50 (132 PGA)	0	85		
	A80960JD-40 (132 PGA)	0	100		
	A80960JD-33 (132 PGA)	0	100		
	NG80960JD-40 (132 PQFP)	0	100		
	NG80960JD-33 (132 PQFP)	0	100		

4.3 Connection Recommendations

For clean on-chip power distribution, V_{CC} and V_{SS} pins separately feed the device's functional units. Power and ground connections must be made to all 80960JD power and ground pins. On the circuit board, every V_{CC} pin should connect to a power plane and every V_{SS} pin should connect to a ground plane. Place liberal decoupling capacitance near the 80960JD, since the processor can cause transient power surges.

Pay special attention to the Test Reset (\overline{TRST}) pin. It is essential that the JTAG Boundary Scan Test Access Port (TAP) controller initializes to a known state whether it will be used or not. If the JTAG Boundary Scan function will be used, connect a pulldown resistor between the \overline{TRST} pin and V_{SS} . If the JTAG Boundary Scan function will not be used (even for board-level testing), connect the \overline{TRST} pin to V_{SS} . Also, do not connect the TDI, TDO, and TCK pins if the TAP Controller will not be used.

Pins identified as NC must not be connected in the system.

4.4 DC Specifications

Table 13. 80960JD DC Characteristics

Symbol	Parameter	Min	Typ	Max	Units	Notes
V_{IL}	Input Low Voltage	-0.3		0.8	V	
V_{IH}	Input High Voltage	2.0		$V_{CC} + 0.3$	V	
V_{OL}	Output Low Voltage			0.45	V	$I_{OL} = 5 \text{ mA}$
V_{OH}	Output High Voltage	2.4 $V_{CC} - 0.5$			V	$I_{OH} = -1 \text{ mA}$ $I_{OH} = -200 \mu\text{A}$
V_{OLP}	Output Ground Bounce		< 0.8		V	(1,2)
C_{IN}	Input Capacitance PGA PQFP			12 10	pF	$f_{CLKIN} = f_{MIN} (2)$
C_{OUT}	I/O or Output Capacitance PGA PQFP			12 10	pF	$f_{CLKIN} = f_{MIN} (2)$
C_{CLK}	CLKIN Capacitance PGA PQFP			12 10	pF	$f_{CLKIN} = f_{MIN} (2)$

NOTES:

1. Typical is measured with $V_{CC} = 5.0\text{V}$ and temperature = 25 °C.
2. Not tested.

Table 14. 80960JD I_{CC} Characteristics

Symbol	Parameter	Typ	Max	Units	Notes	
I _{LI1}	Input Leakage Current for each pin except TCK, TDI, $\overline{\text{TRST}}$ and TMS		± 1	µA	0 ≤ V _{IN} ≤ V _{CC}	
I _{LI2}	Input Leakage Current for TCK, TDI, $\overline{\text{TRST}}$ and TMS	-140	-250	µA	V _{IN} = 0.45V (1)	
I _{LO}	Output Leakage Current		± 1	µA	0.4 ≤ V _{OUT} ≤ V _{CC}	
I _{CC} Active (Power Supply)	80960JD-50		640	mA	(2,3)	
	80960JD-40		530		(2,3)	
	80960JD-33		450		(2,3)	
I _{CC} Active (Thermal)	80960JD-50	525		mA	(2,4)	
	80960JD-40	430			(2,4)	
	80960JD-33	365			(2,4)	
I _{CC} Test (Power modes)	Reset mode			mA		
	80960JD-50		510		(5)	
	80960JD-40		430		(5)	
	80960JD-33		370		(5)	
	Halt mode					
	80960JD-50		48		(5)	
	80960JD-40		41		(5)	
80960JD-33		36	(5)			
	ONCE mode		10		(5)	

NOTES:

1. These pins have internal pullup devices. Typical leakage current is not tested.
2. Measured with device operating and outputs loaded to the test condition in Figure 8, AC Test Load (pg. 33).
3. I_{CC} Active (Power Supply) value is provided for selecting your system's power supply. It is measured using one of the worst case instruction mixes with V_{CC} = 5.25V. This parameter is characterized but not tested.
4. I_{CC} Active (Thermal) value is provided for your system's thermal management. Typical I_{CC} is measured with V_{CC} = 5.0V and temperature = 25° C. This parameter is characterized but not tested.
5. I_{CC} Test (Power modes) refers to the I_{CC} values that are tested when the 80960JD is in Reset mode, Halt mode or ONCE mode with V_{CC} = 5.25V.

4.5 AC Specifications

The 80960JD AC timings are based upon device characterization.

Table 15. 80960JD AC Characteristics (50 MHz) (Sheet 1 of 2)

Symbol	Parameter	Min	Max	Units	Notes
INPUT CLOCK TIMINGS					
T_F	CLKIN Frequency	8	25	MHz	
T_C	CLKIN Period	40	125	ns	
T_{CS}	CLKIN Period Stability		± 250	ps	(1, 2)
T_{CH}	CLKIN High Time	16		ns	Measured at 1.5 V (1)
T_{CL}	CLKIN Low Time	16		ns	Measured at 1.5 V (1)
T_{CR}	CLKIN Rise Time		25	ns	0.8 V to 2.0 V (1)
T_{CF}	CLKIN Fall Time		5	ns	2.0 V to 0.8 V (1)
SYNCHRONOUS OUTPUT TIMINGS					
T_{OV1}	Output Valid Delay, Except \overline{ALE}/ALE Inactive and DT/\overline{R}	3.5	17	ns	(3)
T_{OV2}	Output Valid Delay, DT/\overline{R}	$0.5T_C + 3.5$	$0.5T_C + 17$	ns	
T_{OF}	Output Float Delay	3.5	15	ns	(4)
SYNCHRONOUS INPUT TIMINGS					
T_{IS1}	Input Setup to CLKIN — AD31:0, NMI, XINT7:0	8		ns	(5)
T_{IH1}	Input Hold from CLKIN — AD31:0, NMI, XINT7:0	2		ns	(5)
T_{IS2}	Input Setup to CLKIN — RDYRCV and HOLD	9		ns	(6)
T_{IH2}	Input Hold from CLKIN — RDYRCV and HOLD	1		ns	(6)
T_{IS3}	Input Setup to CLKIN — RESET	8		ns	(7)
T_{IH3}	Input Hold from CLKIN — RESET	2		ns	(7)
T_{IS4}	Input Setup to \overline{RESET} — ONCE, STEST	8		ns	(8)
T_{IH4}	Input Hold from \overline{RESET} — ONCE, STEST	2		ns	(8)

NOTE: See Table 16 on page 28 for note definitions for this table.

Table 15. 80960JD AC Characteristics (50 MHz) (Sheet 2 of 2)

Symbol	Parameter	Min	Max	Units	Notes
RELATIVE OUTPUT TIMINGS					
T_{LXL}	ALE/ALE Width	$0.5T_C - 7.5$		ns	(9)
T_{LXA}	Address Hold from ALE/ALE Inactive				Equal Loading (9)
T_{DXD}	DT/R Valid to DEN Active				Equal Loading (9)
BOUNDARY SCAN TEST SIGNAL TIMINGS					
T_{BSF}	TCK Frequency		$0.5T_F$	MHz	
T_{BSCH}	TCK High Time	15		ns	Measured at 1.5 V (1)
T_{BSCL}	TCK Low Time	15		ns	Measured at 1.5 V (1)
T_{BSCR}	TCK Rise Time		5	ns	0.8 V to 2.0 V (1)
T_{BSCF}	TCK Fall Time		5	ns	2.0 V to 0.8 V (1)
T_{BSIS1}	Input Setup to TCK — TDI, TMS	4		ns	
T_{BSIH1}	Input Hold from TCK — TDI, TMS	6		ns	
T_{BSOV1}	TDO Valid Delay	3	30	ns	(1,10)
T_{BSOF1}	TDO Float Delay	3	30	ns	(1,10)
T_{BSOV2}	All Outputs (Non-Test) Valid Delay	3	30	ns	(1,10)
T_{BSOF2}	All Outputs (Non-Test) Float Delay	3	30	ns	(1,10)
T_{BSIS2}	Input Setup to TCK — All Inputs (Non-Test)	4		ns	
T_{BSIH2}	Input Hold from TCK — All Inputs (Non-Test)	6		ns	

NOTE: See Table 16 on page 28 for note definitions for this table.

Table 16. Note Definitions for Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26)

NOTES:	
1.	Not tested.
2.	To ensure a 1:1 relationship between the amplitude of the input jitter and the internal clock, the jitter frequency spectrum should not have any power peaking between 500 KHz and 1/3 of the CLKIN frequency.
3.	Inactive ALE/ $\overline{\text{ALE}}$ refers to the falling edge of ALE and the rising edge of $\overline{\text{ALE}}$. For inactive ALE/ $\overline{\text{ALE}}$ timings, refer to Relative Output Timings in this table.
4.	A float condition occurs when the output current becomes less than I_{LO} . Float delay is not tested, but is designed to be no longer than the valid delay.
5.	AD31:0 are synchronous inputs. Setup and hold times must be met for proper processor operation. $\overline{\text{NMI}}$ and XINT7:0 may be synchronous or asynchronous. Meeting setup and hold time guarantees recognition at a particular clock edge. For asynchronous operation, NMI and XINT7:0 must be asserted for a minimum of two CLKIN periods to guarantee recognition.
6.	$\overline{\text{RDYRCV}}$ and HOLD are synchronous inputs. Setup and hold times must be met for proper processor operation.
7.	$\overline{\text{RESET}}$ may be synchronous or asynchronous. Meeting setup and hold time guarantees recognition at a particular clock edge.
8.	ONCE and STEST must be stable at the rising edge of $\overline{\text{RESET}}$ for proper operation.
9.	Guaranteed by design. May not be 100% tested.
10.	Relative to falling edge of TCK.

Figure 35. Summary of Aligned and Unaligned Accesses (32-Bit Bus)

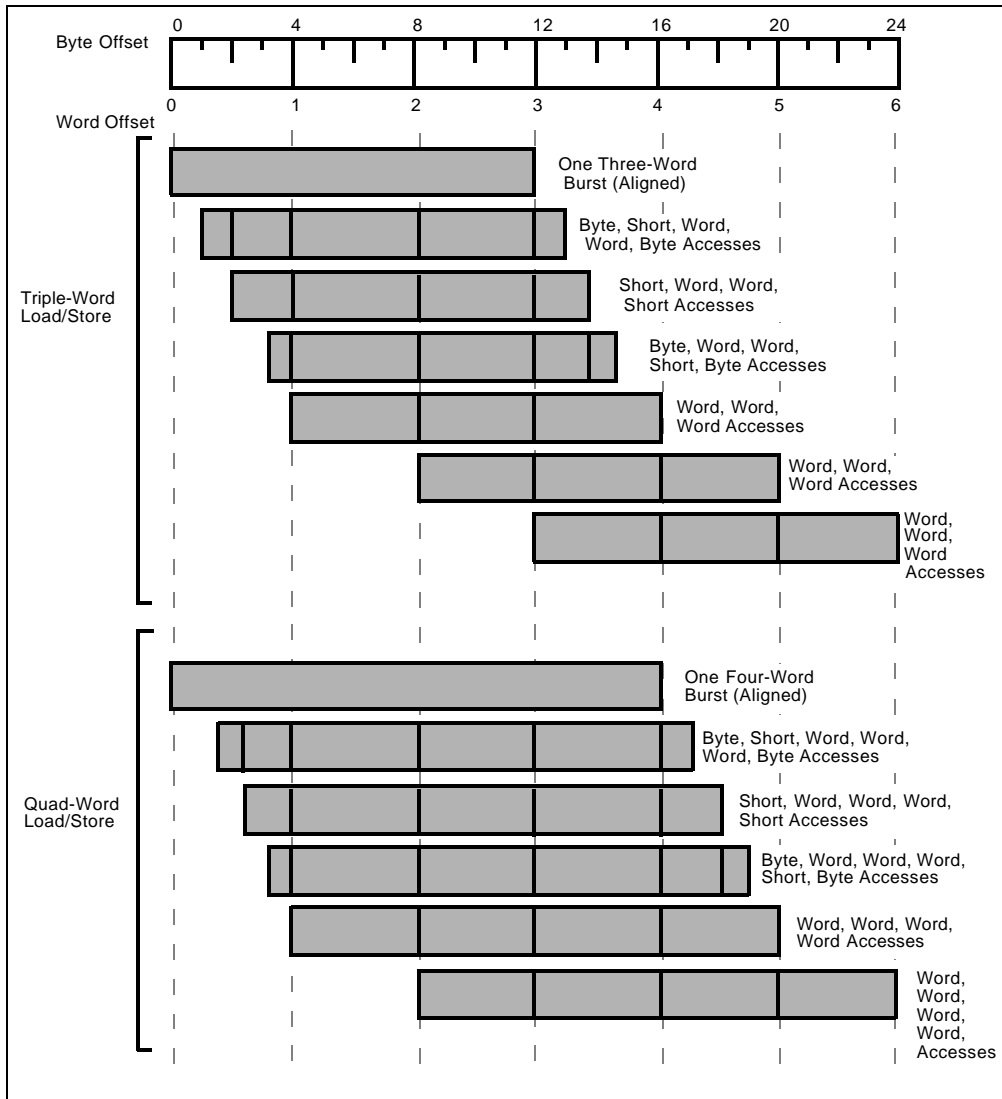

Figure 36. Summary of Aligned and Unaligned Accesses (32-Bit Bus) (Continued)

6.0 DEVICE IDENTIFICATION

80960JD processors may be identified electrically according to device type and stepping (see Table 23). The 32-bit identifier is accessible in three ways:

- Upon reset, the identifier is placed into the g0 register.
- The identifier may be accessed from supervisor mode at any time by reading the DEVICEID register at address FF008710H.
- The IEEE Standard 1149.1 Test Access Port may select the DEVICE ID register through the IDCODE instruction.

The device and stepping letter is also printed on the top side of the product package.

Table 23. 80960JD Die and Stepping Reference

Device and Stepping	Version Number	Part Number	Manufacturer	X	Complete ID (Hex)
80960JD A, A2	0000	1000 1000 0010 0000	0000 0001 001	1	08820013

NOTE: This data sheet applies to the 80960JD A and 80960JD A2 steppings.

7.0 REVISION HISTORY

This data sheet supersedes revision 272596-001. Table 24 indicates significant changes since the previous revision.

Table 24. Data Sheet Version -001 to -002 Revision History (Sheet 1 of 2)

Table 13, 80960JD DC Characteristics (pg. 24)	Removed I _{CC} characteristics. Added V _{OLP} (output ground bounce) specification
Table 14, 80960JD ICC Characteristics (pg. 25)	New table for comprehensible I _{CC} characteristics. Added I _{CC} 's for reset mode. Halt I _{CC} for: 80960JD-50 (max) improved from 56 mA to 48 mA, 80960JD-40 (max) improved from 44 mA to 41mA. ONCE I _{CC} Improved from 30 mA to 10 mA.
Section 4.5, AC Specifications (pg. 26)	Grouped AC Specifications tables by frequency. Added 40 MHz and 33 MHz AC specifications.
Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26) Section INPUT CLOCK TIMINGS	T _{CS} (max) improved from ±0.1% to ±250 ps
Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26) Section SYNCHRONOUS OUTPUT TIMINGS	T _{ov1} (min) improved from 3.0 ns to 3.5 ns. T _{ov2} (min) improved from 0.45T _C + 3.0 ns to 0.5T _C + 3.5 ns. T _{oF} (min) improved from 3.0 ns to 3.5 ns. T _{oF} (max) improved from 17 ns to 15 ns.

Table 24. Data Sheet Version -001 to -002 Revision History (Sheet 2 of 2)

Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26) Section SYNCHRONOUS INPUT TIMINGS	T_{IS2} (min) improved from 10 ns to 9 ns
Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26) Section RELATIVE OUTPUT TIMINGS	T_{LXL} , T_{LXA} , and T_{DXD} (min) improved from $.45T_C - 3$ ns to $.5T_C - 7.5$ ns.
Table 15, 80960JD AC Characteristics (50 MHz) (pg. 26) Section BOUNDARY SCAN TEST SIGNAL TIMINGS	T_{BSF} (max) improved from 8 MHz to $.5T_F$. T_{BSIS1} (min) improved from 8 ns to 4 ns. T_{BSIH1} (min) improved from 10 ns to 6 ns. T_{BSIS2} (min) improved from 8 ns to 4 ns. T_{BSIH2} (min) improved from 10 ns to 6 ns.
