DESCRIPTION

The *ISSI* IS61LV256 is a very high-speed, low power, 32,768-word by 8-bit static RAM. It is fabricated using *ISSI*'s high-performance CMOS technology. This highly reliable process coupled with innovative circuit design techniques, yields access times as fast as 8 ns maximum.

When $\overline{CE}$ is HIGH (deselected), the device assumes a standby mode at which the power dissipation is reduced to 50 µW (typical) with CMOS input levels.

Easy memory expansion is provided by using an active LOW Chip Enable ($\overline{CE}$). The active LOW Write Enable ($\overline{WE}$) controls both writing and reading of the memory.

The IS61LV256 is available in the JEDEC standard 28-pin, 300-mil SOJ and the 450-mil TSOP (Type I) package.

Notes:
1. Test conditions assume signal transition times of 3 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V and output loading specified in Figure 1.
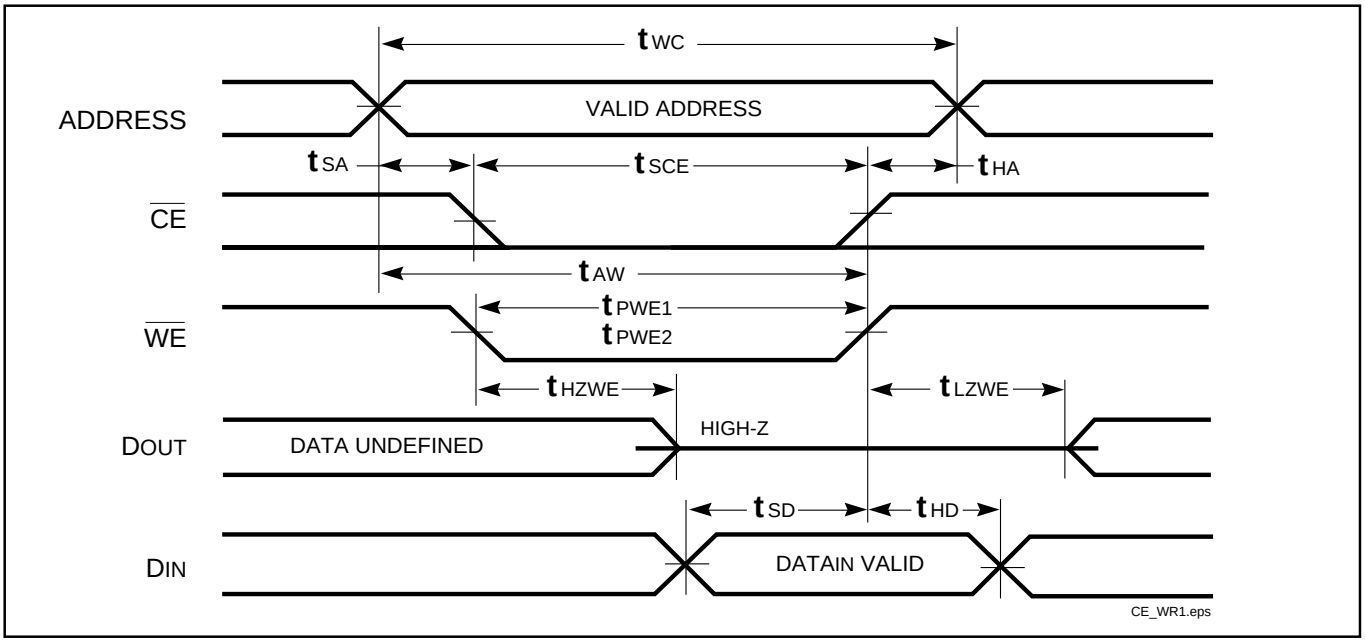
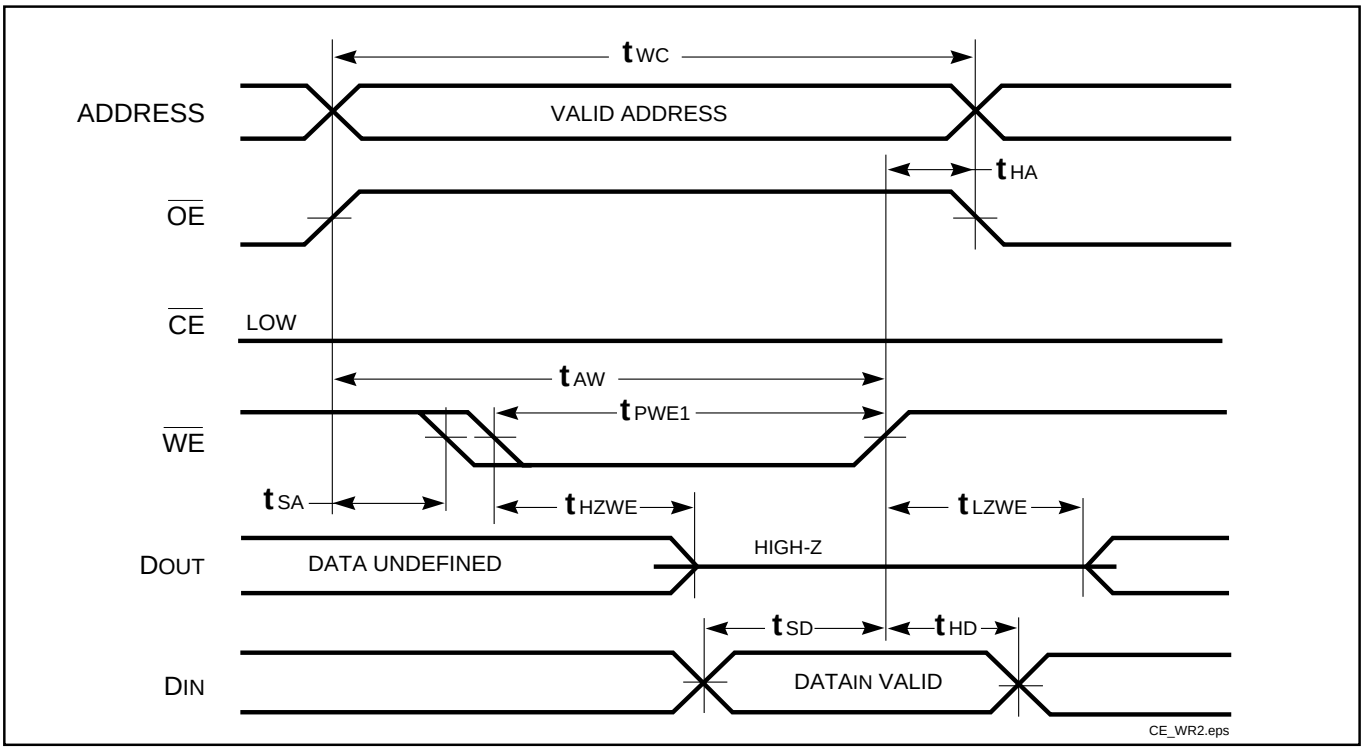
2. The internal write time is defined by the overlap of $\overline{CE}$ LOW and $\overline{WE}$ LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
3. Shaded area = **PREPRODUCTION AVAILABILITY.**
4. Tested with the load in Figure 2. Transition is measured ±500 mV from steady-state voltage. Not 100% tested.

AC WAVEFORMS

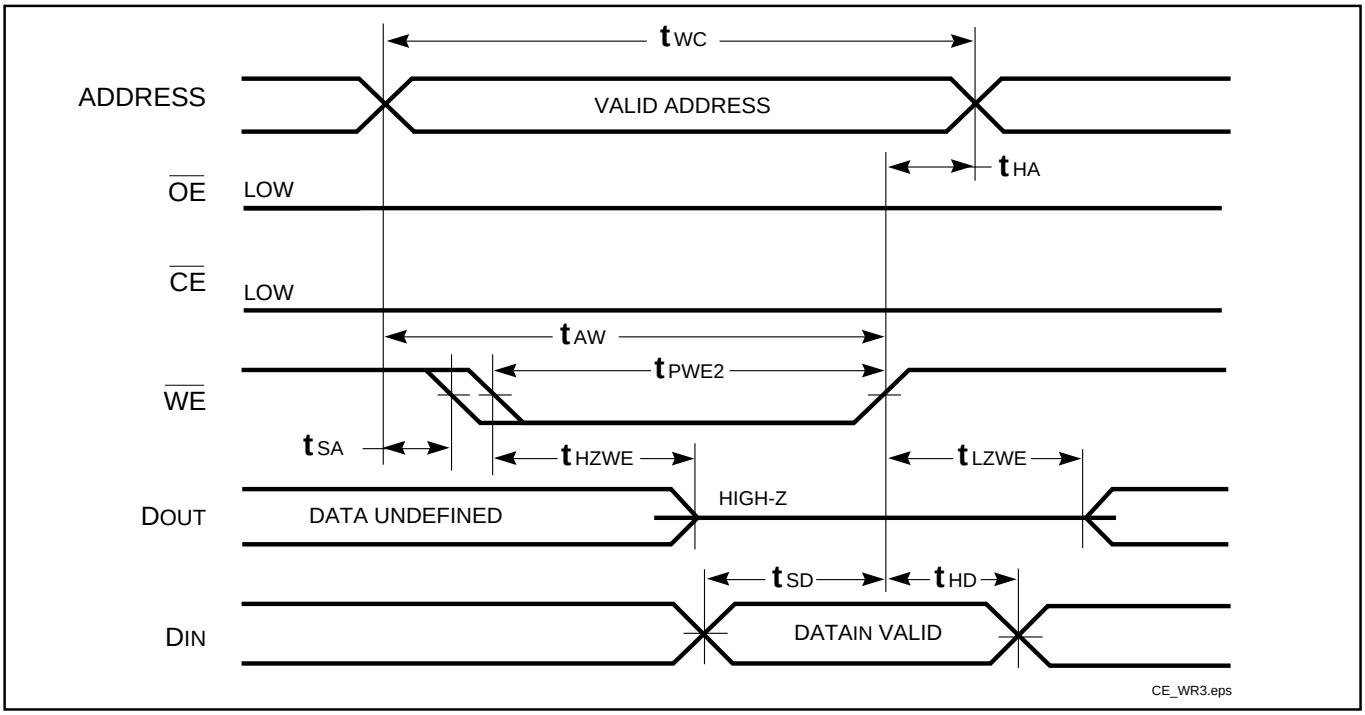
WRITE CYCLE NO. 1 ($\overline{CE}$ Controlled, $\overline{OE}$ is HIGH or LOW) (1)



WRITE CYCLE NO. 2 ($\overline{WE}$ Controlled, $\overline{OE}$ is HIGH During Write Cycle) [1,2]



WRITE CYCLE NO. 3 ($\overline{WE}$ Controlled, $\overline{OE}$ is LOW During Write Cycle) [1]



Notes:

1. The internal write time is defined by the overlap of $\overline{CE}$ LOW and $\overline{WE}$ LOW. All signals must be in valid states to initiate a Write, but any one can go inactive to terminate the Write. The Data Input Setup and Hold timing are referenced to the rising or falling edge of the signal that terminates the Write.
2. I/O will assume the High-Z state if $\overline{OE}$ • V_{IH}.
