

64K x 32 SYNCHRONOUS STATIC RAM WITH NO-WAIT STATE BUS FEATURE

ADVANCE INFORMATION
JULY 1998

FEATURES

- Fast access time:
 - 5 ns-100 MHz; 6 ns-83 MHz;
 - 7 ns-75 MHz; 8 ns-66 MHz
- No wait cycles between Read and Write
- Internal self-timed write cycle
- Individual Byte Write Control
- Clock controlled, registered address, data and control
- Pentium™ or linear burst sequence control using MODE input
- Three chip enables for simple depth expansion and address pipelining
- Common data inputs and data outputs
- JEDEC 100-pin TQFP and PQFP package
- Single +3.3V power supply
- Optional data strobe pin (#80) for latching data (See page 12 for detailed timing)

DESCRIPTION

The IS61NW6432 is a high-speed, low-power synchronous static RAM designed to provide a burstable, high-performance, 'no-wait' bus, secondary cache for the Pentium, 680X0, and Power PC microprocessors. It is organized as 65,536 words by 32 bits, fabricated with *ISSI's* advanced CMOS technology.

Incorporating a 'no-wait' bus, wait cycles are eliminated when the bus switches from read to write, or write to read. This device integrates a 2-bit burst counter, high-speed SRAM core, and high-drive capability outputs into a single monolithic circuit.

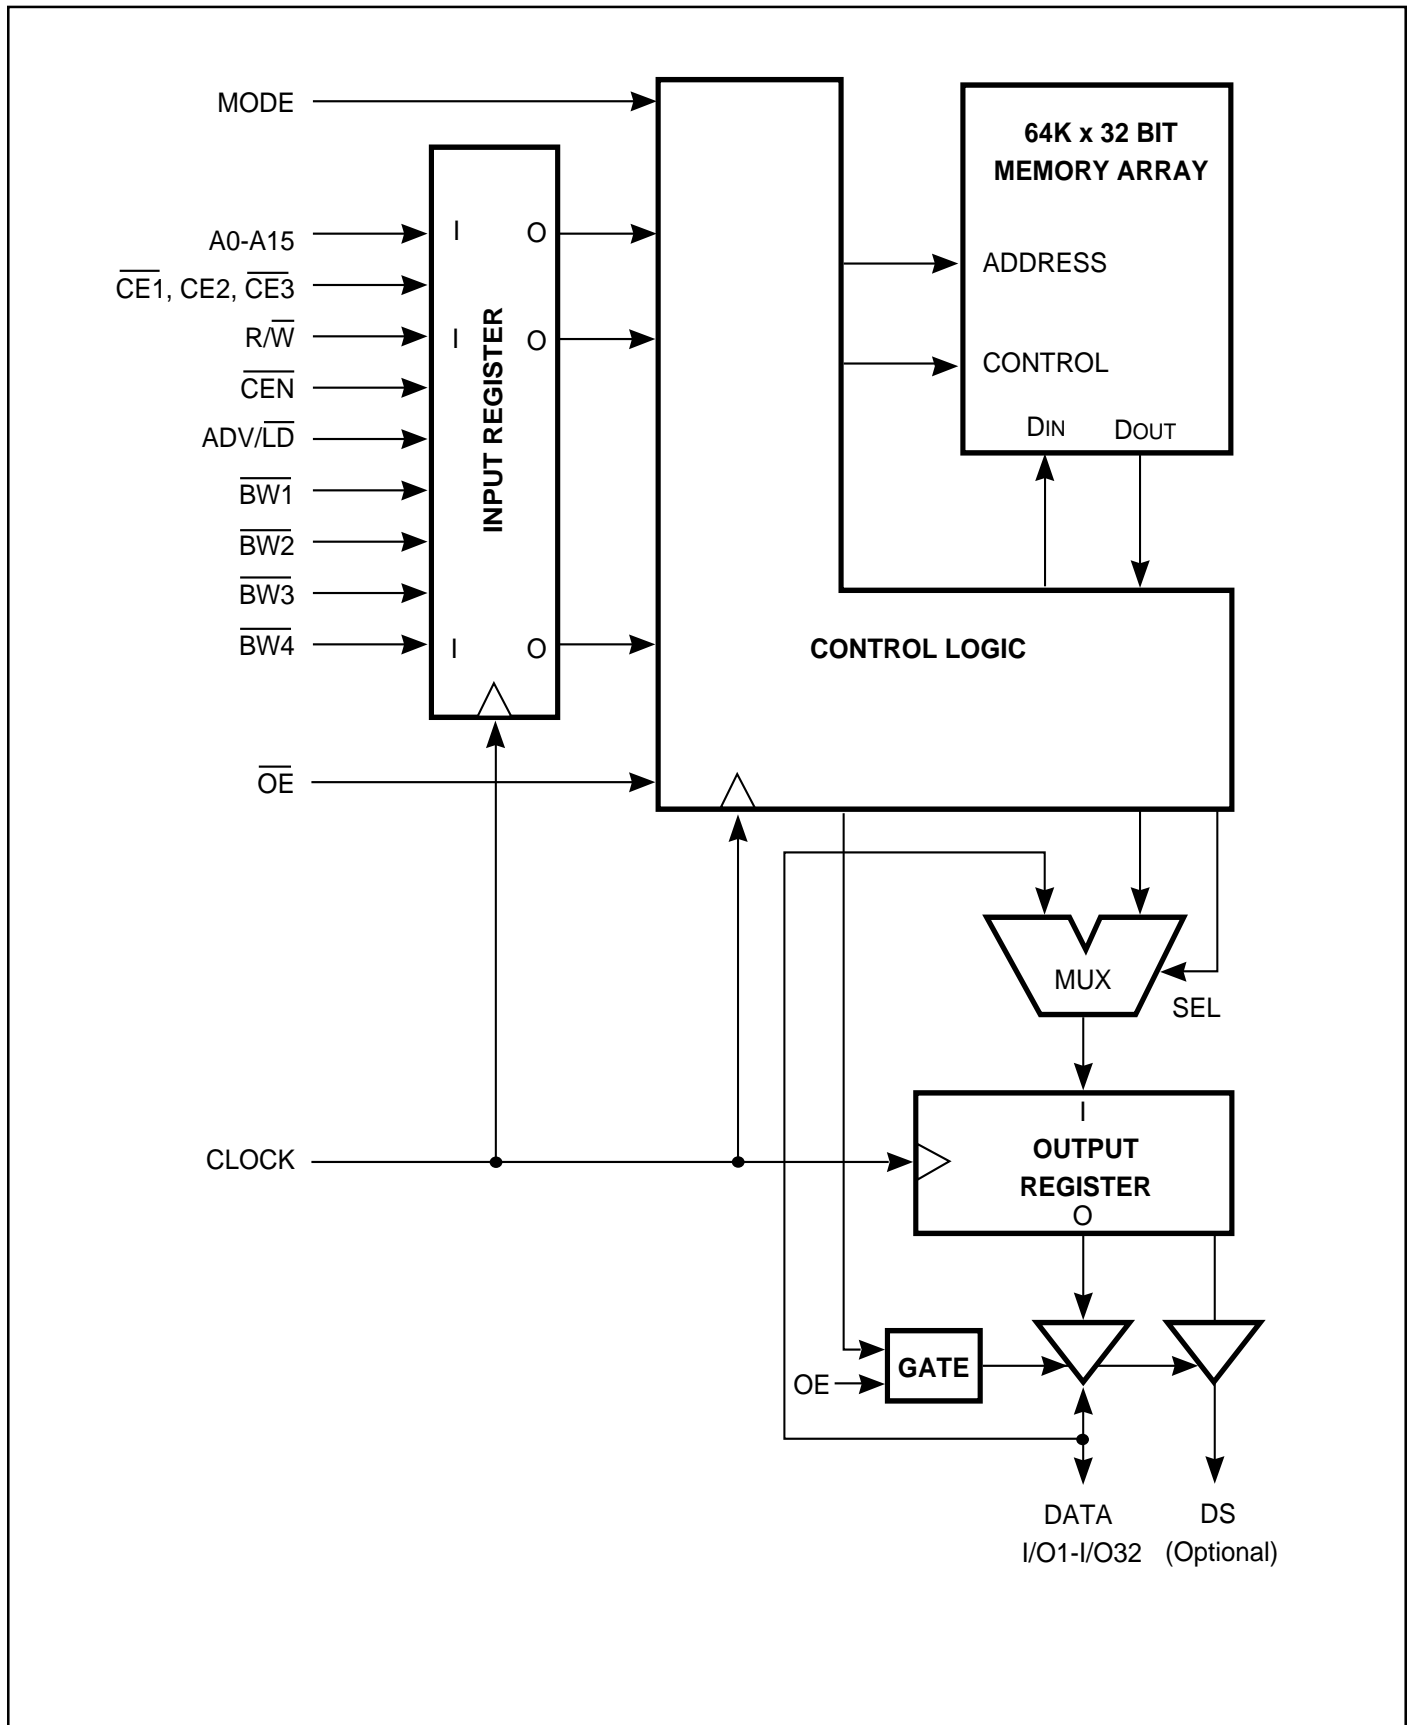

All synchronous inputs pass through registers controlled by a positive-edge-triggered clock input. Operations may be suspended and all synchronous inputs ignored when Clock Enable, \overline{CEN} is HIGH. In this state the internal device will hold their previous values.

When the $\overline{ADV/LD}$ is HIGH the internal burst counter is incremented. New external addresses can be loaded when $\overline{ADV/LD}$ is LOW.

Write cycles are internally self-timed and are initiated by the rising edge of the clock inputs and when $\overline{RD/WE}$ is LOW. Separate byte enables allow individual bytes to be written. $\overline{BW1}$ controls I/O1-I/O8; $\overline{BW2}$ controls I/O9-I/O16; $\overline{BW3}$ controls I/O17-I/O24; $\overline{BW4}$ controls I/O25-I/O32. All Bytes are written when $\overline{BW1}$, $\overline{BW2}$, $\overline{BW3}$, and $\overline{BW4}$ are LOW.

MODE pin upon power up is in interleave burst mode. It can be connected to GNDQ or VCCQ to alter power up state.

Deselect (2 Cycle) ⁽³⁾	X	X	H	L	L	X	L-H
Hold/NOOP ⁽⁴⁾	X	X	X	X	H	X	L-H

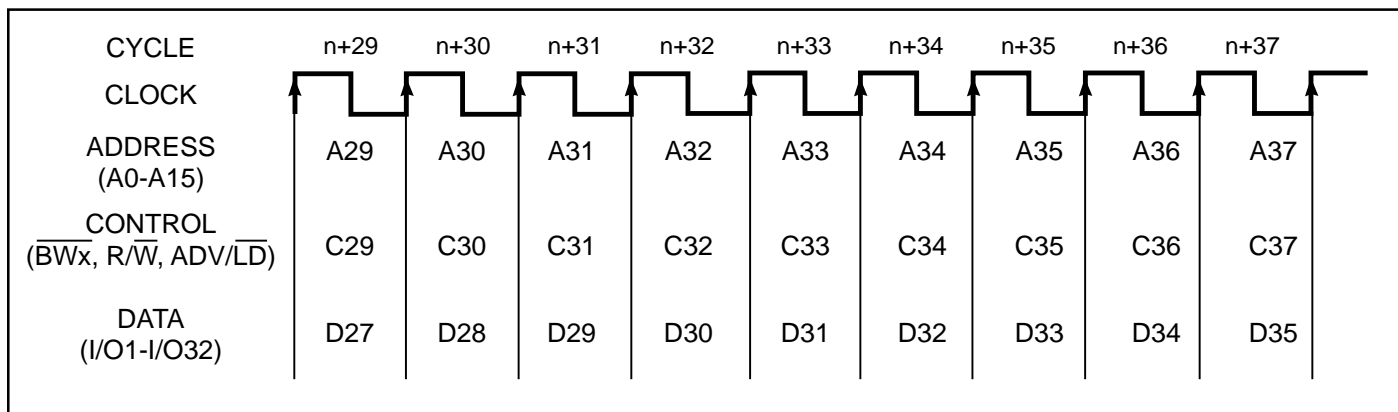

Notes:

- "X" Means don't care.
- When ADV/LD signal is sampled HIGH, the internal burst counter is incremented. The R/W signal is ignored when the counter is advanced. Therefore, the nature of the burst cycle (Read or Write) is determined by the status of the R/W signal when the first address is loaded at the beginning of the burst cycle.
- Deselect cycle is initiated when \overline{CE}_x is sampled HIGH and ADV/LD sampled LOW at rising edge of clock. The data bus will tri-state two cycles after deselect is initiated.
- When \overline{CEN} is sampled high at the rising edge of clock, that clock edge is blocked from propagating through the part. The state of all the internal registers remains unchanged.

V _{IN}	Voltage Relative to GND for for Address and Control Inputs	-0.5 to 5.5	V

Notes:

1. Stress greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, precautions may be taken to avoid application of any voltage higher than maximum rated voltages to this high-impedance circuit.
3. This device contains circuitry that will ensure the output devices are in High-Z at power up.
