

**ADVANCED RF PROCESSOR**

KIA2082F is an advanced RF processor for car tuners. An FM front end and AM tuner are internal parts are drastically reduced. Car tuners with both FM/AM require only the KIA2093F post-stage advanced FM processor and KIA2082F to realize a tuner with very high-quality performance.

**FEATURES**

- FM Front End Block
- Super Balanced mixer (Ermitter input)
- VCO
- VCO Buffer Output
- IF Amp
- Super NLA (Narrow Linear AGC)
- Band Select

**AM Tuner Block**

- Up Conversion Double Super Heterodyne
- Super Balance Mixer 1
- Super Balance Mixer 2
- VCO
- VCO Buffer Output
- Oscillator
- IF Amp
- 2 Supper AGC for RF Stage (delayed AGC)

- AM Detection.
- Narrow Band Signal Meter Output.
- IF count Output and IF Output for AM Stereo Decoder with Request.
- SD Output.
- 2 AGC for IF Stage.
- IF AGC speed-up.
- Built-in AGC over Reponse Improve Circuit.
- Operating Supply Voltage :  $V_{opr}=8\pm 1V$ .

**MAXIMUM RATINGS (Ta=25°C)**

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	$V_{CC}$	10	V
Power Dissipation (Note)	$P_D$	890	mW
Operating Temperature	$T_{opr}$	-40~85	°C
Storage Temperature	$T_{stg}$	-55~150	°C
Pin <sup>②</sup> Flow Current	$I_{28}$	6	mA
Pin <sup>②</sup> Applied Voltage	$V_{(Req.)}$	6	V

(Note) When using at temperatures higher than 25°C, maximum power dissipation decreases by 7.12mW for every 1°C over 25°C. See Figure 1 for the relationship between the pwer dissipation and the ambient temperature when using.

**Fig.1 POWER DISSIPATION ( $P_D$ )- OPERATING AMBIENT TEMPERATURE ( $T_a$ )**

## FEATURES

### FM Front End Block

- The Balanced input-type mixers, which do not require a balun coil, offer improved intermodulation distortion while improving total IP by 12dB over the conventional level.
  - : Total IP $\approx$ 115dB $\mu$ V(Typ.) when 3SK195+KIA2082F.
- ...Jis dummy input terminal regulation
  - Replace the varactor with a fixed capacitor of a similar capacitance.
- Expands the IF amp dynamic range and improves AMR and tweet interference characteristics about 20dB $\mu$ V above the previous product. Therefore, the RF AGC sensitivity can be set as desired without AMR deterioration.
  - : Field strength where AMR deterioration starts  $\geq$ 90dB $\mu$ V(Typ.) (at RF AGC off)
- The pattern and wiring can be designed more freely because the VCO buffer output drivability is improved.
  - : With 680 $\Omega$ /15pF load,  $\approx$ 110dB $\mu$ V (Typ.)
- Incorporates an advanced NLA. The NLA uses the signal meter output (a means of detecting the field strength of the target station) to control the synthetic output from the wide AGC detected from the signal in the RF amp bandwidth and the middle AGC detected from the signal in the mixer bandwidth. This improves sensitivity rejection, the result of near-detuning interference, while improving the IM distortion over a wide range up to far-detuning interference.

### AM Tuner Block

- Because of the up conversion, KIA2082F is compatible with LW reception.
- Because of improved cross modulation distortion at balance mixer 1 and 2, and the effective AGC, the overall cross modulation distortion matches the distortion obtained by the down conversion.
  - : US  $\approx$ 21dB $\mu$ V (Typ.)
  - IP  $\approx$ 124dB $\mu$ V (Typ.)
  - : S/N  $\approx$ 8dB(Typ.) when Vd=40dB $\mu$ V EMF, Vu=120dB $\mu$ V EMF,  $\Delta$ F=40kHz
- Although the dynamic range is expanded without a ceramic resonator, the signal meter output operates without malfunction caused by far-detuning interference.
  - : Signal meter output dynamic range  $\approx$ 60dB(Typ.)
- The noise convergence can be set as desired.
- Supports an SD output pin for memory scan.
- The SD output and the IF count output are synchronized. The detection sensitivity for the field strength can be set anywhere within the signal meter output dynamic range.
- The request function operates at a seek and the IF system supports two types of AGC speed-up. Thus, the response of the distortion ratio, SD output, and IF count output are balanced at both low FM and high AM signal strengths.
  - : THD  $\approx$ -40dB(Typ.) at 100Hz, 80% AM.
  - : SD output and IF count output generation time  $\approx$ 12mS(Typ.)
- For compatibility with Motorola-type AM stereo reception, the C/N of the AM VCO is improved and the quality of stereo S/N matches the down conversion stereo S/N.
  - : S/N  $\approx$ 42dB(Typ.) When Vd=74dB $\mu$ V EMF, AM=400Hz/30%
  - : f<sub>CL</sub>=200Hz, -18dB/oct. wiggling
- The VCO buffer output is a single output pin type that is connected to both AM and FM VCOs by switching. External switches are not necessary. As with the FM front end block, pattern and wiring design freedom is improved because of the single output pin and better drivability.
  - : With 6.8k $\Omega$ /15pF load  $\approx$ 110dB $\mu$ V (Typ.)
- Oscillation tolerance in relation to the crystal oscillator is improved.
  - : With standard crystal, additional series resistance when the mixer gain starts to drop  $\approx$ 620 $\Omega$  (Typ.)

## DESCRIPTION OF PIN FUNCTIONS

(Pin Voltage indicate standard values in the test circuit at  $V_{CC}=8.5V$ ,  $T_a=25^{\circ}C$  and no AC signal is input)

PIN No.	PIN NAME	PIN VOLTAGE(V) FM/AM	INTERNAL EQUIVALENT CIRCUIT/ INTERNAL STANDARD VALUE (INTERNAL R,C TYPICAL VALUES)	PIN FUNCTION
48	AM 1'st Mixer in 1	0/0.6		AM 1'st Mixer input terminal • External RF Amp. (ex. TOKO 7PD1249)
1	AM 1'st Mixer in 21	0/0.6		FM Mixer and AM 1'st Mixer output terminal. • External 10.7MHz IFT (ex. TOKO 7KLL7170D) • External ceramic filter for FM, AM via PIN diode (ex. TSB 1SV237) • AM 1'st Mixer is to be stopped at FM • FM 1'st Mixer is to be stopped at AM
2	Mixer-out1	8.5/8.5		
3	Mixer-out2	8.5/8.5		
4	FM Reference	4.1/0		Reference voltage source for FM. • External capacitance • 0V, stop FM operating at AM mode.
5	FM IF Amp-in	1.9/0		FM IF Amp. input terminal. • External ceramic filter
6	FM IF Amp -bypass	1.9/0		FM IF Amp. input bypass terminal. • External capacitance
9	FM IF Amp-out	3.4/7.7		FM IF Amp. output terminal. • External ceramic filter
