

3V AM/FM IF+MPX
(for Digital Tuning System)

KIA6032AN/AF are the AM/FM IF+MPX system IC's, which are designed for DTS radios. These are included many functions and these can be used for digital tuning system with IF counter.

FEATURES

- Built-in AM/FM IF stereo PLL multiplex decoder.
- Suitable for combination with digital tuning system which is included IF counter.
 - : One terminal type AM/FM IF count output (auto stop signal) for IF counter of digital tuning system.
 - {FM : 10.7MHz Changeable by 1.3375MHz(1/8 dividing)} external switch
 - AM : 450kHz
 - : Built-in mute circuit for IF count output. It is controlled by the if request signal from digital tuning system.
 - pin ⑩ level : high → come out
 - low → non output
 - : Adjustable for IF count output sensitivity by external resistance of pin ②.
- For adopting ceramic discriminator and ceramic resonator, it is not necessary to adjust the FM quad detector circuit and MPX VCO circuit.
- Built-in one terminal type AM low cut circuit.
- Operating supply voltage range.
 - : $V_{CC}=1.8\sim 8.0V$ ($T_a=25^\circ C$)

MAXIMUM RATINGS ($T_a=25^\circ C$)

CHARACTERISTIC	SYMBOL	RATING	UNIT
Supply Voltage	V_{CC}	8	V
LED Current	I_{LED}	10	mA
LED Voltage	V_{LED}	8	V
Power Dissipation	KIA6032AN	P_D	1200
	KIA6032AF	(Note)	
Operating Temperature	T_{opr}	-25~75	$^\circ C$
Storage Temperature	T_{stg}	-55~150	$^\circ C$

Note : Derated above $T_a=25^\circ C$ in the proportion of 9.6mW/ $^\circ C$ for KIA6032AN and of 3.2mW/ $^\circ C$ for KIA6032AF

APPLICATION NOTE

1. How to control the IF Count Output Signal (pin ⑨ output)

		TUN LED	
		ON	OFF
V8	H	Come out	Non output
	L	Non output	Non output

·Whether or not there is the IF count output signal (pin⑨ output) is determined by the AND of the pin ⑩ control voltage : V8 and tuning LED on/off switching.

In the condition of

V8 : High (Active High, $V_{IH}=0.8V$ (Typ.))

TUN LED : ON($V_{IN} \geq V_L + 2dB\mu$ (Typ.))

the IF count output signal comes out from the pin ⑨.

In the case of the Tuning LED function is not needed, it doesn't matter the pin ⑩ is opened.

·The output impedance of pin ⑨ is $1.5k\Omega$ (Typ.) (cf. P.4)

It is possible to reduce the IF count output signal level to add the resistance between the pin ⑨ and the V_{CC} line.

·The signal waveform is the rectangular wave, and the $500mV_{P-P}$ (Typ.)

2. How to control the Divider of FM IF

KIA6032AN/AF

3. How to adjust the IF count output sensitivity

•The IF Count Output Sensitivity (Search sensitivity) can be adjusted by varying the IF AMP gain for FM and varying the Mixer gain for AM. This setting is made by changing the value of external resistance R2 which is connected to pin ②.

•However, this is only possible at the Auto-tuning Mode. (external voltage supplied to pin ③ is at High level.) The original again returns while receiving a broadcast station (supplied voltage to pin ③ is at LOW level.)

• The Gain Loss of FM IF AMP

		R2	
		0Ω	10kΩ (Note)
MODE	IF (10.7MHz)	-20dB	-1dB
	1/8IF (1.3375MHz)	-20dB	-1dB

(Note)

- In the condition of the 1/8 IF Mode, it is possible to set up R2=∞ (open)
- In the condition of IF Mode, it is necessary to set up the value of R2 under 10kΩ. When the R2 is over 10kΩ it is feared that the Mode is change to the 1/8 IF Mode.

• The Gain Loss of AM Mixer

R2	
0Ω	10kΩ
-16dB	-1dB

KIA6032AN/AF

4. AM Low-Cut Circuit

- The AM Low-Cut action is carried out by the bypass of the high frequency component of the positive-feedback signal at the AM AMP stage.
The external capacitor : C6 by-passes this component.
- The cut-off frequency f_L is determined by the internal resistance $22k\Omega$ (Typ.) and the external capacitor C6 as following :

$$f_L = \frac{1}{2 \times \pi \times 22 \times 10^3 \times C6} \text{ (Hz)}$$

- In the case of the AM Low-Cut function is not needed, set up the value of C6 over $0.47\mu F$. In the condition of $C6 \geq 0.47\mu F$, the frequency characteristic has flat response at the low frequency.

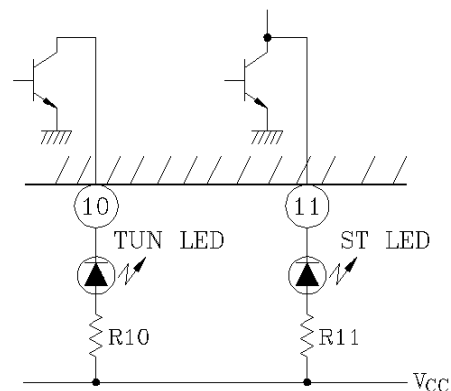

5. AM Local Oscillator Buffer Output

- The output impedance of AM Local Oscillator Buffer Output pin (pin④) is 750Ω (Typ.) (cf. P.3)
- It is possible to reduce the output level to add the resistance between the pin ④ and V_{CC} line. The signal waveform is the rectangular wave, and the level is $500mV_{p-p}$ ($f_{osc}=1.45MHz$, Typ.) The higher local oscillation frequency (f_{osc}) to be, the lower buff output level to be owing to the load capacity. So, in the case that it is connected to other circuits, take care of the input capacity of these circuits and stray capacity of wire.

6. Tuning LED Driver and Stereo LED Driver.

- The Tuning LED Driver and stereo LED driver don't have current limit resistance shown in the right figure. So, it is necessary to add the current limit resistance : R10, R11.
- Set up the values of R10, R11 to keep the drive currents $ID10$, $ID11$ under $10mA$.

KIA6032AN/AF

7. FM Detection Circuit

For the FM detection circuit, detection coil is able to use instead of ceramic discriminator. Recommended circuit and recommended coil are as follows.
In this case, please take care the $V_{in(lim)}$ falls a little.

TEST FREQUENCY	Co (pF)	Qo	TURNS				WIRE (mm ϕ)	REF
			1-2	2-3	1-3	4-6		
10.7MHz	100	100			12		SUMIDA ELECTRIC CO., LTD 2153-4095-189 or KWANG SUNG ELECTRONICS CO., LTD. KSFD505	

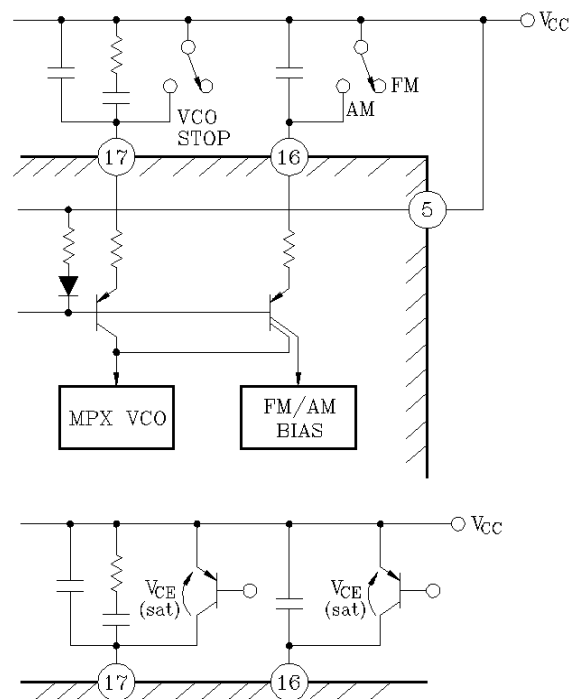

8. FM/AM Switch and Forced Monaural

Switch FM/AM switchover and stare/forced monaural switchover are done by internal PNP transistors ON/OFF which are connected to pin ⑮ and pin ⑯ respectively.

The threshold voltages of these PNP transistors are $V_{th}=V_{cc}$, and for switching, we recommend to use mechanical switch. (Direct short to V_{cc} line.)

In the case of the electrical switchover by transistor, set up V_{CE} (saturation voltage between collector and base.)

50mV or less, otherwise there are some cases that it does not become the AM mode and force monaural mode. When these external switches are ON, the currents which flow into pin ⑮ and pin ⑯ are 100 μ A and 20 μ A respectively. (Typical value at $V_{cc}=3V$.)
