

Low Power 5V RS232 Dual Driver/Receiver with 0.1 μ F Capacitors

FEATURES

- ESD Protection over $\pm 10\text{kV}$
- Low Cost
- Uses Small Capacitors: 0.1 μF
- CMOS Comparable Low Power: 40mW
- Operates from a Single 5V Supply
- 120kbaud Operation for $R_L = 3\text{k}$, $C_L = 2500\text{pF}$
- 250kbaud Operation for $R_L = 3\text{k}$, $C_L = 1000\text{pF}$
- Rugged Bipolar Design
- Outputs Assume a High Impedance State When Powered Down
- Absolutely No Latchup
- Available in Narrow SO Package

APPLICATIONS

- Portable Computers
- Battery-Powered Systems
- Power Supply Generator
- Terminals
- Modems

DESCRIPTION

The LT[®]1381 is a dual RS232 driver/receiver pair with integral charge pump to generate RS232 voltage levels from a single 5V supply. The circuit features rugged bipolar design to provide operating fault tolerance and ESD protection unmatched by competing CMOS designs. Using only 0.1 μF external capacitors, the circuit consumes only 40mW of power and can operate to 120kbaud even while driving heavy capacitive loads. New ESD structures on the chip allow the LT1381 to survive multiple $\pm 10\text{kV}$ strikes, eliminating the need for costly TransZorbs[®] on the RS232 line pins. Driver outputs are protected from overload and can be shorted to ground or up to $\pm 25\text{V}$ without damage. During power-off conditions, driver and receiver outputs are in a high impedance state, allowing line sharing.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.
 TransZorb[®] is a registered trademark of General Instruments, GSI

ELECTRICAL CHARACTERISTICS (Note 2)

PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS
Receiver					
Input Voltage Thresholds	Input Low Threshold ($V_{OUT} = \text{High}$)	0.8	1.3		V
	Input High Threshold ($V_{OUT} = \text{Low}$)		1.7	2.4	V
Hysteresis		● 0.1	0.4	1.0	V
Input Resistance	(Note 6)	3	5	7	k Ω
Output Voltage	Output Low, $I_{OUT} = -1.6\text{mA}$	● 0.2		0.4	V
	Output High, $I_{OUT} = 160\mu\text{A}$ ($V_{CC} = 5\text{V}$)	● 3.5	4.2		V
Output Short-Circuit Current	Sinking Current, $V_{OUT} = V_{CC}$		-20	-10	mA
	Sourcing Current, $V_{OUT} = 0\text{V}$	10	20		mA
Propagation Delay	Output Transition t_{HL} High-to-Low (Note 5)		250	600	ns
	Output Transition t_{LH} Low-to-High		350	600	ns

The ● denotes specifications which apply over the full operating temperature range.

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.

Note 2: Testing done at $V_{CC} = 5\text{V}$, unless otherwise specified.

Note 3: Supply current is measured as the average over several charge pump cycles. $C^+ = C^- = C1 = C2 = 0.1\mu\text{F}$. All outputs are open, with all driver inputs tied high.

Note 4: For driver delay measurements, $R_L = 3\text{k}$ and $C_L = 51\text{pF}$. Trigger points are set between the driver's input logic threshold and the output transition to the zero crossing ($t_{HL} = 1.4\text{V}$ to 0V and $t_{LH} = 1.4\text{V}$ to 0V).

Note 5: For receiver delay measurements, $C_L = 51\text{pF}$. Trigger points are set between the receiver's input logic threshold and the output transition to standard TTL/CMOS logic threshold ($t_{HL} = 1.3\text{V}$ to 2.4V and $t_{LH} = 1.7\text{V}$ to 0.8V).

Note 6: Tested at $V_{IN} = \pm 10\text{V}$.

PIN FUNCTIONS

C1⁺, C1⁻, C2⁺, C2⁻ (Pins 1, 3, 4, 5): Commutating Capacitor Inputs. These pins require two external capacitors $C \geq 0.1\mu\text{F}$: one from C1⁺ to C1⁻ and another from C2⁺ to C2⁻. C1 may be deleted if a separate 12V supply is available and connected to pin C1⁺.

V⁺ (Pin 2): Positive Supply Output (RS232 Drivers). $V^+ \approx 2V_{CC} - 2.1\text{V}$. This pin requires an external charge storage capacitor $C \geq 0.1\mu\text{F}$, tied to ground or V_{CC} . Larger value capacitors may be used to reduce supply ripple. With multiple transceivers, the V⁺ and V⁻ pins may be paralleled into common capacitors.

V⁻ (Pin 6): Negative Supply Output (RS232 Drivers). $V^- \approx -(2V_{CC} - 3\text{V})$. This pin requires an external charge storage capacitor $C \geq 0.1\mu\text{F}$. Larger value capacitors may be used to reduce supply ripple. With multiple transceivers, the V⁺ and V⁻ pins may be paralleled into common capacitors.

TR2 OUT, TR1 OUT (Pin 7, 14): Driver Outputs at RS232 Voltage Levels. Driver output swing meets RS232 levels for loads up to 3k. Slew rates are controlled for lightly loaded lines. Output current capability is sufficient for load conditions up to 2500pF. Outputs are in a high impedance state when $V_{CC} = 0\text{V}$. Outputs are fully short-circuit protected from $V^- + 25\text{V}$ to $V^+ - 25\text{V}$. Applying

higher voltages will not damage the device if the overdrive is moderately current limited. Short circuits on one output can load the power supply generator and may disrupt the signal levels of the other outputs. The driver outputs are protected against ESD to $\pm 10\text{kV}$ for human body model discharges.

REC2 IN, REC1 IN (Pins 8, 13): Receiver Inputs. These pins accept RS232 level signals ($\pm 30\text{V}$) into a protected 5k terminating resistor. The receiver inputs are protected against ESD to $\pm 10\text{kV}$ for human body model discharges. Each receiver provides 0.4V of hysteresis for noise immunity. Open receiver inputs assume a logic low state.

REC2 OUT, REC1 OUT (Pins 9, 12): Receiver Outputs with TTL/CMOS Voltage Levels. Outputs are fully short-circuit protected to ground or V_{CC} with the power ON or OFF.

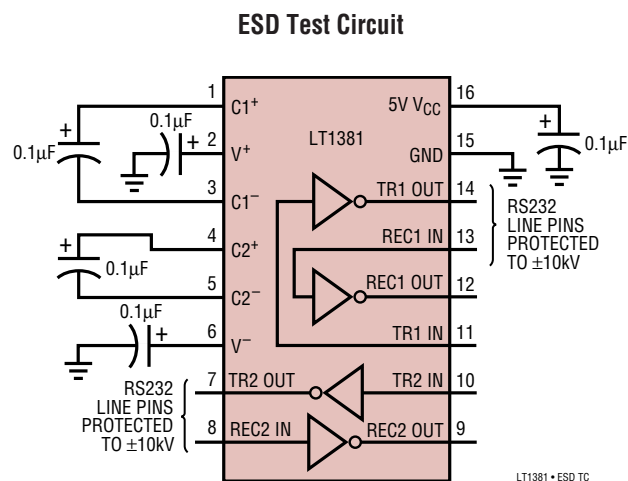

TR2 IN, TR1 IN (Pins 10, 11): RS232 Driver Input Pins. These inputs are TTL/CMOS compatible. Inputs should not be allowed to float. Tie unused inputs to V_{CC} .

GND (Pin 15): Ground Pin.

V_{CC} (Pin 16): 5V Input Supply Pin. This pin should be decoupled with a 0.1 μF ceramic capacitor close to the package pin. Insufficient supply bypassing can result in low output drive levels and erratic charge pump operation.

ESD PROTECTION

The RS232 line inputs of the LT1381 have on-chip protection from ESD transients up to $\pm 10\text{kV}$. The protection structures act to divert the static discharge safely to system ground. In order for the ESD protection to function effectively, the power supply and ground pins of the circuit must be connected to ground through low impedances. The power supply decoupling capacitors and charge pump storage capacitors provide this low impedance in normal application of the circuit. The only constraint is that low ESR capacitors must be used for bypassing and charge storage. ESD testing must be done with pins V_{CC} , V⁺, V⁻ and GND shorted to ground or connected with low ESR capacitors.
