

Micropower, Low-Voltage, SOT23, Rail-to-Rail I/O Comparators

General Description

The MAX985/MAX986/MAX989/MAX990/MAX993/MAX994 single/dual/quad micropower comparators feature low-voltage operation and Rail-to-Rail® inputs and outputs. Their operating voltage ranges from +2.5V to +5.5V, making them ideal for both 3V and 5V systems. These comparators also operate with $\pm 1.25V$ to $\pm 2.75V$ dual supplies. They consume only 11 μA of supply current while achieving a 300ns propagation delay.

The common-mode input voltage range extends 250mV beyond the supply rails. Input bias current is typically 1.0pA, and input offset voltage is typically 0.5mV. Internal hysteresis ensures clean output switching, even with slow-moving input signals.

The output stage's unique design limits supply-current surges while switching, virtually eliminating the supply glitches typical of many other comparators. This design also minimizes overall power consumption under dynamic conditions. The MAX985/MAX989/MAX993 have a push/pull output stage that sinks as well as sources current. Large internal output drivers allow rail-to-rail output swing with loads up to 8mA. The MAX986/MAX990/MAX994 have an open-drain output stage that can be pulled beyond V_{CC} to 6V (max) above V_{EE} . These open-drain versions are ideal for level translators and bipolar to single-ended converters.

The single MAX985/MAX986 are available in tiny 5-pin SOT23 packages.

Selector Guide

PART	COMPARATORS PER PACKAGE	OUTPUT STAGE	PIN-PACKAGE
MAX985	1	Push/Pull	8 SO/ 5 SOT23-5
MAX986	1	Open-Drain	8 SO/ 5 SOT23-5
MAX989	2	Push/Pull	8 SO/ μ MAX
MAX990	2	Open-Drain	8 SO/ μ MAX
MAX993	4	Push/Pull	14 SO
MAX994	4	Open-Drain	14 SO

Applications

Portable/Battery-Powered Systems	Threshold Detectors/ Discriminators
Mobile Communications	Ground/Supply Sensing Applications
Zero-Crossing Detectors	IR Receivers
Window Comparators	Digital Line Receivers
Level Translators	

Features

- ◆ 11 μA Quiescent Supply Current
- ◆ +2.5V to +5.5V Single-Supply Operation
- ◆ Common-Mode Input Voltage Range Extends 250mV Beyond the Rails
- ◆ 300ns Propagation Delay
- ◆ Push/Pull Output Stage Sinks and Sources 8mA Current (MAX985/MAX989/MAX993)
- ◆ Open-Drain Output Voltage Extends Beyond V_{CC} (MAX986/MAX990/MAX994)
- ◆ Unique Output Stage Reduces Output Switching Current, Minimizing Overall Power Consumption
- ◆ 80 μA Supply Current at 1MHz Switching Frequency
- ◆ No Phase Reversal for Overdriven Inputs
- ◆ Available in Space-Saving Packages:
SOT23 (MAX985/MAX986)
 μ MAX (MAX989/MAX990)

MAX986/MAX990/MAX994	-0.3V to 6V	14-Pin SO (derate 8.33 mW/°C above +70°C).....	667mW
OUT_ Short-Circuit Duration to VEE or VCC	10sec	Operating Temperature Range	-40°C to +85°C
		Storage Temperature Range	-65°C to +150°C
		Lead Temperature (soldering, 10sec)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(VCC = +2.7V to +5.5V, VEE = 0V, VCM = 0V, TA = -40°C to +85°C, unless otherwise noted. Typical values are at TA = +25°C.) (Note 1)

	t_{PD+}	MAX985/MAX989/ MAX993 only, $C_L = 15pF$	10mV overdrive	450			
			100mV overdrive	300			
Power-Up Time	t_{PU}				20		μs

Note 1: The MAX98_EUK specifications are 100% tested at $T_A = +25^{\circ}C$. Limits over the extended temperature range are guaranteed by design, not production tested.

Note 2: Inferred from the V_{OS} test. Either or both inputs can be driven 0.3V beyond either supply rail without output phase reversal.

Note 3: V_{OS} is defined as the center of the hysteresis band at the input.

Note 4: I_B is defined as the average of the two input bias currents (I_{B-} , I_{B+}).

MAX985/MAX986/MAX989/MAX990/MAX993/MAX994

Micropower, Low-Voltage, SOT23, Rail-to-Rail I/O Comparators

Detailed Description

The MAX985/MAX986/MAX989/MAX990/MAX993/MAX994 are single/dual/quad low-power, low-voltage comparators. They have an operating supply voltage range between +2.5V and +5.5V and consume only 11 μ A. Their common-mode input voltage range extends 0.25V beyond each rail. Internal hysteresis ensures clean output switching, even with slow-moving input signals. Large internal output drivers allow rail-to-rail output swing with up to 8mA loads.

The output stage employs a unique design that minimizes supply-current surges while switching, virtually eliminating the supply glitches typical of many other comparators. The MAX985/MAX989/MAX993 have a push/pull output structure that sinks as well as sources current. The MAX986/MAX990/MAX994 have an open-drain output stage that can be pulled beyond V_{CC} to an absolute maximum of 6V above V_{EE} .

Input Stage Circuitry

The devices' input common-mode range extends from -0.25V to ($V_{CC} + 0.25V$). These comparators may operate at any differential input voltage within these limits. Input bias current is typically 1.0pA if the input voltage is between the supply rails. Comparator inputs are protected from overvoltage by internal body diodes connected to the supply rails. As the input voltage exceeds the supply rails, these body diodes become forward biased and begin to conduct. Consequently, bias currents increase exponentially as the input voltage exceeds the supply rails.

Output Stage Circuitry

These comparators contain a unique output stage capable of rail-to-rail operation with up to 8mA loads. Many comparators consume orders of magnitude more current during switching than during steady-state operation. However, with this family of comparators, the supply-current change during an output transition is extremely small. The *Typical Operating Characteristics* graph Supply Current vs. Output Transition Frequency shows the minimal supply-current increase as the output switching frequency approaches 1MHz. This characteristic eliminates the need for power-supply filter capacitors to reduce glitches created by comparator switching currents. Another advantage realized in high-speed, battery-powered applications is a substantial increase in battery life.

Figure 1. Additional Hysteresis (MAX985/MAX989/MAX993)

Applications Information

Additional Hysteresis

MAX985/MAX989/MAX993

The MAX985/MAX989/MAX993 have $\pm 3mV$ internal hysteresis. Additional hysteresis can be generated with three resistors using positive feedback (Figure 1). Unfortunately, this method also slows hysteresis response time. Use the following procedure to calculate resistor values for the MAX985/MAX989/MAX993.

- 1) Select R_3 . Leakage current at IN is under 10nA, so the current through R_3 should be at least $1\mu A$ to minimize errors caused by leakage current. The current through R_3 at the trip point is $(V_{REF} - V_{OUT}) / R_3$. Considering the two possible output states in solving for R_3 yields two formulas: $R_3 = V_{REF} / 1\mu A$ or $R_3 = (V_{REF} - V_{CC}) / 1\mu A$. Use the smaller of the two resulting resistor values. For example, if $V_{REF} = 1.2V$ and $V_{CC} = 5V$, then the two R_3 resistor values are $1.2M\Omega$ and $3.8M\Omega$. Choose a $1.2M\Omega$ standard value for R_3 .
- 2) Choose the hysteresis band required (V_{HB}). For this example, choose 50mV.
- 3) Calculate R_1 according to the following equation:

$$R_1 = R_3 \times (V_{HB} / V_{CC})$$

For this example, insert the values $R_1 = 1.2M\Omega \times (50mV / 5V) = 12k\Omega$.

- 4) Choose the trip point for V_{IN} rising (V_{THR} ; V_{THF} is the trip point for V_{IN} falling). This is the threshold voltage at which the comparator switches its output from low to high as V_{IN} rises above the trip point. For this example, choose 3V.

Micropower, Low-Voltage, SOT23, Rail-to-Rail I/O Comparators

5) Calculate R2 as follows. For this example, choose an 8.2kΩ standard value:

$$R2 = \frac{1}{\left(\frac{V_{THR}}{V_{REF} \times R1}\right) - \frac{1}{R1} - \frac{1}{R3}}$$

$$R2 = \frac{1}{\left(\frac{3.0V}{1.2 \times 12k\Omega}\right) - \frac{1}{12k\Omega} - \frac{1}{2.2M\Omega}} = 8.03k\Omega$$

6) Verify trip voltages and hysteresis as follows:

$$V_{IN \text{ rising}}: V_{THR} = V_{REF} \times R1 \times \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3}\right)$$

$$V_{IN \text{ falling}}: V_{THF} = V_{THR} - \left(\frac{R1 \times V_{CC}}{R3}\right)$$

$$\text{Hysteresis} = V_{THR} - V_{THF}$$

MAX986/MAX990/MAX994

The MAX986/MAX990/MAX994 have ±3mV internal hysteresis. They have open-drain outputs and require an external pull-up resistor (Figure 2). Additional hysteresis can be generated using positive feedback, but the formulas differ slightly from those of the MAX985/MAX989/MAX993.

Figure 2. Additional Hysteresis (MAX986/MAX990/MAX994)

Use the following procedure to calculate resistor values:

1) Select R3 according to the formulas $R3 = V_{REF} / 500\mu A$ or $R3 = (V_{REF} - V_{CC}) / 500\mu A - R4$. Use the smaller of the two resulting resistor values.

2) Choose the hysteresis band required (VHB). For this example, choose 50mV.

3) Calculate R1 according to the following equation:

$$R1 = (R3 + R4) \times (V_{HB} / V_{CC})$$

4) Choose the trip point for V_{IN} rising (V_{THR} ; V_{THF} is the trip point for V_{IN} falling). This is the threshold voltage at which the comparator switches its output from low to high as V_{IN} rises above the trip point.

5) Calculate R2 as follows:

$$R2 = \frac{1}{\left(\frac{V_{THR}}{V_{REF} \times R1}\right) - \frac{1}{R1} - \frac{1}{R3 + R4}}$$

6) Verify trip voltages and hysteresis as follows:

$$V_{IN \text{ rising}}: V_{THR} = V_{REF} \times R1 \times \left(\frac{1}{R1} + \frac{1}{R2} + \frac{1}{R3 + R4}\right)$$

$$V_{IN \text{ falling}}: V_{THF} = V_{THR} - \left(\frac{R1 \times V_{CC}}{R3 + R4}\right)$$

$$\text{Hysteresis} = V_{THR} - V_{THF}$$

Board Layout and Bypassing

Power-supply bypass capacitors are not typically needed, but use 100nF bypass capacitors when supply impedance is high, when supply leads are long, or when excessive noise is expected on the supply lines. Minimize signal trace lengths to reduce stray capacitance.

Micropower, Low-Voltage, SOT23, Rail-to-Rail I/O Comparators

Zero-Crossing Detector

Figure 3 shows a zero-crossing detector application. The MAX985's inverting input is connected to ground, and its noninverting input is connected to a 100mVp-p signal source. As the signal at the noninverting input crosses 0V, the comparator's output changes state.

Figure 3. Zero-Crossing Detector

Logic-Level Translator

Figure 4 shows an application that converts 5V logic levels to 3V logic levels. The MAX986 is powered by the +5V supply voltage, and the pull-up resistor for the MAX986's open-drain output is connected to the +3V supply voltage. This configuration allows the full 5V logic swing without creating overvoltage on the 3V logic inputs. For 3V to 5V logic-level translation, simply connect the +3V supply to VCC and the +5V supply to the pull-up resistor.

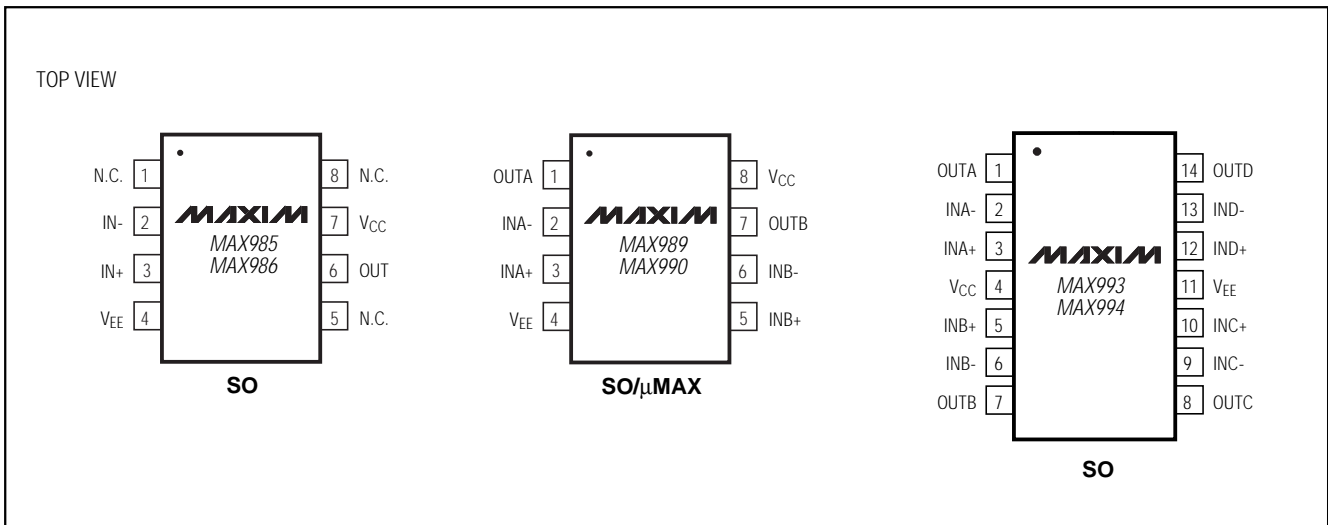

Figure 4. Logic-Level Translator
