

MAXIM

Low Offset Voltage Operational Amplifier

OP07

General Description

The OP07 is a precision operational amplifier with very low input offset voltage ($10\mu\text{V}$ typ., $25\mu\text{V}$ max. for the OP07A), input offset drift of $0.2\mu\text{V}/^\circ\text{C}$ and low input bias current of 0.7nA . The wide input common mode range of $\pm 14\text{V}$ combined with high CMRR of 110dB minimum (OP07A), plus high input impedance and high open-loop gain make these devices particularly useful for high-gain instrumentation applications.

The excellent linearity and gain accuracy are maintained at high open-loop gains, over both time and temperature. The OP07 has become an industry standard and Maxim's reliability and quality are added advantages.
