DRAM

1 MEG x 4 DRAM

STANDARD OR LOW POWER, EXTENDED REFRESH

FEATURES

- 1,024-cycle refresh distributed across 16ms (MT4C4001J) or 128ms (MT4C4001J L)
- Industry-standard x4 pinout, timing, functions and packages
- High-performance CMOS silicon-gate process
- Single +5V ±10% power supply
- All inputs, outputs and clocks are TTL-compatible
- Refresh modes: $\overline{RAS}$-ONLY, $\overline{CAS}$-BEFORE-$\overline{RAS}$ (CBR), HIDDEN and BATTERY BACKUP (BBU) (MT4C4001J only)
- FAST-PAGE-MODE access cycle
- Low power, 1mW standby; 275mW active, typical (MT4C4001J L)

OPTIONS / MARKING

• Timing	
60ns access	-6
70ns access	-7
80ns access	-8

*Consult factory on availability of reverse pinout TSOP packages.

GENERAL DESCRIPTION

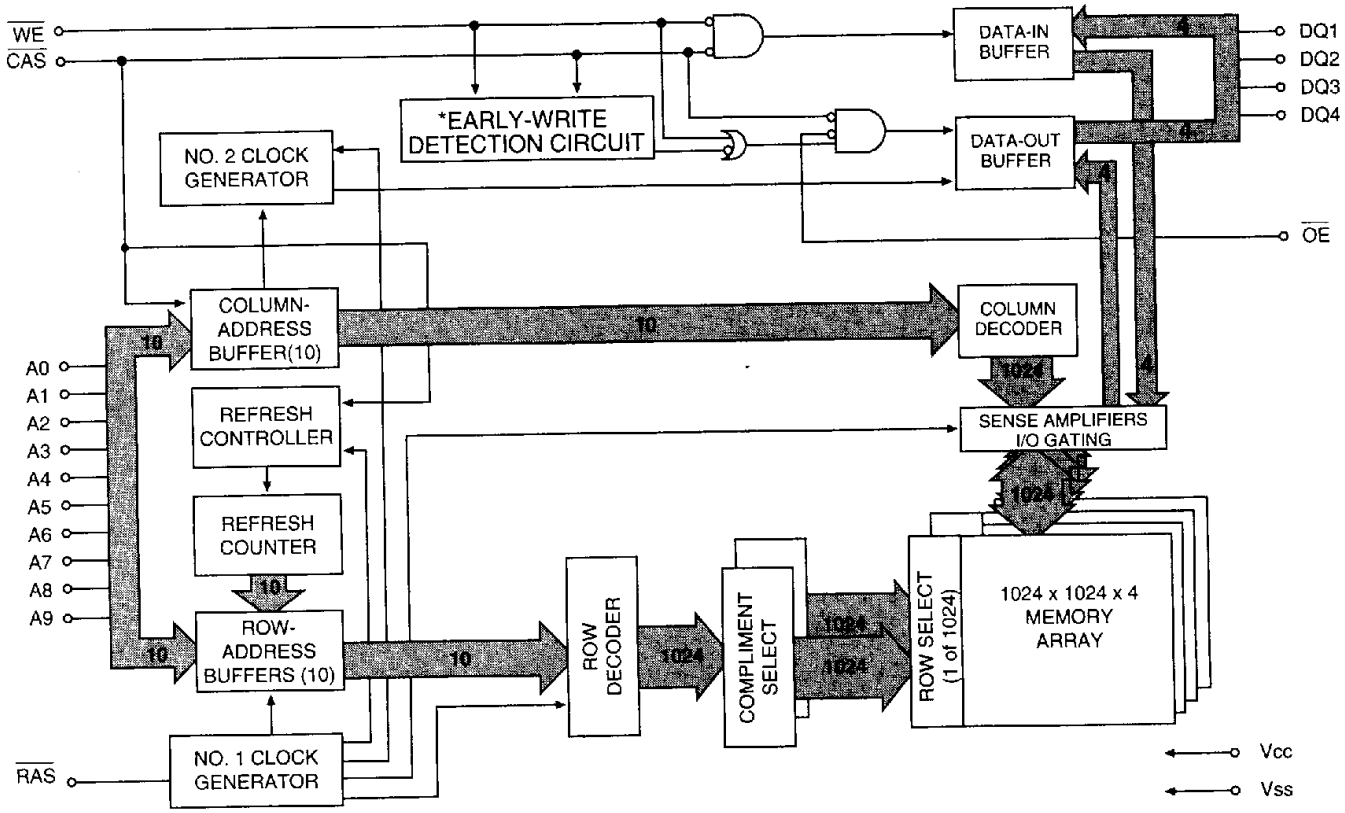
The MT4C4001J L is a randomly accessed solid-state memory containing 4,194,304 bits organized in a x4 configuration. During READ or WRITE cycles, each bit is uniquely addressed through the 20 address bits, which are entered 10 bits (A0-A9) at a time. $\overline{RAS}$ is used to latch the first 10 bits and $\overline{CAS}$ the latter 10 bits. READ and WRITE cycles are selected with the $\overline{WE}$ input. A logic HIGH on $\overline{WE}$ dictates READ mode while a logic LOW on $\overline{WE}$ dictates WRITE mode. During a WRITE cycle, data-in (D) is latched by the falling edge of $\overline{WE}$ or $\overline{CAS}$, whichever occurs last. If $\overline{WE}$ goes LOW prior to $\overline{CAS}$ going LOW, the output pin(s) remain open (High-Z) until the next $\overline{CAS}$ cycle. If $\overline{WE}$ goes LOW after data reaches the output pins, the outputs (Qs) are activated and retain the selected cell data as long as $\overline{CAS}$ remains LOW (regardless of $\overline{WE}$ or $\overline{RAS}$). This late $\overline{WE}$ pulse results in a READ-WRITE cycle. The four data inputs and four data outputs are routed through four pins using common I/O and pin direction is controlled by $\overline{WE}$ and $\overline{OE}$.

FAST-PAGE-MODE operations allow faster data operations (READ, WRITE or READ-MODIFY-WRITE) within a row-address-defined (A0-A9) page boundary. The FAST-PAGE-MODE cycle is always initiated with a row-address strobed-in by $\overline{RAS}$ followed by a column-address strobed-in by $\overline{CAS}$. $\overline{CAS}$ may be toggled-in by holding $\overline{RAS}$ LOW and strobing-in different column-addresses, thus executing faster memory cycles. Returning $\overline{RAS}$ HIGH terminates the FAST-PAGE-MODE operation.

Returning $\overline{RAS}$ and $\overline{CAS}$ HIGH terminates a memory cycle and decreases chip current to a reduced standby level. Also, the chip is preconditioned for the next cycle during the

$\overline{RAS}$ HIGH time. Memory cell data is retained in its correct state by maintaining power and executing any $\overline{RAS}$ cycle (READ, WRITE) or $\overline{RAS}$ REFRESH cycle ($\overline{RAS}$-ONLY, CBR, or HIDDEN) so that all 1,024 combinations of $\overline{RAS}$ addresses (A0-A9) are executed at least every 16ms for the MT4C4001J and every 128ms for the MT4C4001J L, regardless of sequence. The CBR REFRESH cycle will invoke the internal refresh counter for automatic $\overline{RAS}$ addressing.

FUNCTIONAL BLOCK DIAGRAM
FAST-PAGE-MODE



***NOTE:** 1. $\overline{WE}$ LOW prior to $\overline{CAS}$ LOW, EW detection circuit output is a HIGH (EARLY-WRITE)
2. $\overline{CAS}$ LOW prior to $\overline{WE}$ LOW, EW detection circuit output is a LOW (LATE-WRITE)

ABSOLUTE MAXIMUM RATINGS*

Voltage on Any Pin Relative to Vss ..... -1V to +7V
Operating Temperature, T_A (ambient) ..... 0°C to +70°C
Storage Temperature (plastic) ..... -55°C to +150°C
Power Dissipation 1W
Short Circuit Output Current 50mA

*Stresses greater than those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

NOTES

1. All voltages referenced to V_{SS}.
2. This parameter is sampled. V_{CC} = 5V ±10%; f = 1 MHz.
3. I_{CC} is dependent on cycle rates.
4. I_{CC} is dependent on output loading and cycle rates. Specified values are obtained with minimum cycle time and the outputs open.
5. Enables on-chip refresh and address counters.
6. The minimum specifications are used only to indicate cycle time at which proper operation over the full temperature range is assured.
7. An initial pause of 100µs is required after power-up followed by eight $\overline{RAS}$ refresh cycles ($\overline{RAS}$-ONLY or CBR with $\overline{WE}$ HIGH) before proper device operation is assured. The eight $\overline{RAS}$ cycle wake-ups should be repeated any time the ^{t}REF refresh requirement is exceeded.
8. AC characteristics assume ^{t}T = 5ns.
9. V_{IH} (MIN) and V_{IL} (MAX) are reference levels for measuring timing of input signals. Transition times are measured between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}).
10. In addition to meeting the transition rate specification, all input signals must transit between V_{IH} and V_{IL} (or between V_{IL} and V_{IH}) in a monotonic manner.
11. If $\overline{CAS}$ = V_{IH}, data output is High-Z.
12. If $\overline{CAS}$ = V_{IL}, data output may contain data from the last valid READ cycle.
13. Measured with a load equivalent to two TTL gates and 100pF.
14. Assumes that $^{t}RCD < {}^{t}RCD$ (MAX). If ^{t}RCD is greater than the maximum recommended value shown in this table, ^{t}RAC will increase by the amount that ^{t}RCD exceeds the value shown.
15. Assumes that $^{t}RCD \geq {}^{t}RCD$ (MAX).
16. If $\overline{CAS}$ is LOW at the falling edge of $\overline{RAS}$, Q will be maintained from the previous cycle. To initiate a new cycle and clear the data-out buffer, $\overline{CAS}$ must be pulsed HIGH for ^{t}CPN.
17. Operation within the ^{t}RCD (MAX) limit ensures that ^{t}RAC (MAX) can be met. ^{t}RCD (MAX) is specified as a reference point only; if ^{t}RCD is greater than the specified ^{t}RCD (MAX) limit, then access time is controlled exclusively by ^{t}CAC.
18. Operation within the ^{t}RAD (MAX) limit ensures that ^{t}RAC (MIN) and ^{t}CAC (MIN) can be met. ^{t}RAD (MAX) is specified as a reference point only; if ^{t}RAD is greater than the specified ^{t}RAD (MAX) limit, then access time is controlled exclusively by ^{t}AA.
19. Either ^{t}RCH or ^{t}RRH must be satisfied for a READ cycle.
20. ^{t}OFF (MAX) defines the time at which the output achieves the open circuit condition, and is not referenced to V_{OH} or V_{OL}.
21. ^{t}WCS, ^{t}RWD, ^{t}AWD and ^{t}CWD are not restrictive operating parameters. ^{t}WCS applies to EARLY-WRITE cycles. ^{t}RWD, ^{t}AWD and ^{t}CWD apply to READ-MODIFY-WRITE cycles. If $^{t}WCS \geq {}^{t}WCS$ (MIN), the cycle is an EARLY-WRITE cycle and the data output will remain an open circuit throughout the entire cycle. If $^{t}RWD \geq {}^{t}RWD$ (MIN), $^{t}AWD \geq {}^{t}AWD$ (MIN) and $^{t}CWD \geq {}^{t}CWD$ (MIN), the cycle is a READ-MODIFY-WRITE and the data output will contain data read from the selected cell. If neither of the above conditions is met, the state of data-out is indeterminate. $\overline{OE}$ held HIGH and $\overline{WE}$ taken LOW after $\overline{CAS}$ goes LOW results in a LATE-WRITE ($\overline{OE}$-controlled) cycle. ^{t}WCS, ^{t}RWD, ^{t}CWD and ^{t}AWD are not applicable in a LATE-WRITE cycle.
22. These parameters are referenced to $\overline{CAS}$ leading edge in EARLY-WRITE cycles and $\overline{WE}$ leading edge in LATE-WRITE or READ-MODIFY-WRITE cycles.
23. If $\overline{OE}$ is tied permanently LOW, LATE-WRITE or READ-MODIFY-WRITE operations are not possible.
24. A HIDDEN REFRESH may also be performed after a WRITE cycle. In this case, $\overline{WE}$ = LOW and $\overline{OE}$ = HIGH.
25. ^{t}WTS and ^{t}WTH are setup and hold specifications for the $\overline{WE}$ pin being held LOW to enable the JEDEC test mode (with CBR timing constraints). These two parameters are the inverts of ^{t}WRP and ^{t}WRH in the CBR refresh cycle.
26. LATE-WRITE and READ-MODIFY-WRITE cycles must have both ^{t}OD and ^{t}OEH met ($\overline{OE}$ HIGH during WRITE cycle) in order to ensure that the output buffers will be open during the WRITE cycle. If $\overline{OE}$ is taken back LOW while $\overline{CAS}$ remains LOW, the DQs will remain open.
27. The DQs open during READ cycles once ^{t}OD or ^{t}OFF occur. If $\overline{CAS}$ goes HIGH before $\overline{OE}$, the DQs will open regardless of the state of $\overline{OE}$. If $\overline{CAS}$ stays LOW while $\overline{OE}$ is brought HIGH, the DQs will open. If $\overline{OE}$ is brought back LOW ($\overline{CAS}$ still LOW), the DQs will provide the previously read data.
28. BBU current is reduced as ^{t}RAS is reduced from its maximum specification during the BBU cycle.
29. The 3ns minimum is a parameter guaranteed by design.
30. Column-address changed once while $\overline{RAS}$ = V_{IL} and $\overline{CAS}$ = V_{IH}.

4 MEG POWER-UP AND REFRESH CONSTRAINTS

The EIA/JEDEC 4 Meg DRAM introduces two potential incompatibilities compared to the previous generation 1 Meg DRAM. The incompatibilities involve refresh and power-up. Understanding these incompatibilities and providing for them will offer the designer and system user greater compatibility between the 1 Meg and 4 Meg.

REFRESH

The most commonly used refresh cycle of the 1 Meg is the CBR REFRESH cycle. The CBR for the 1 Meg specifies the $\overline{WE}$ pin as a "don't care." The 4 Meg, on the other hand, specifies the CBR REFRESH mode with the $\overline{WE}$ pin held at a voltage HIGH level.

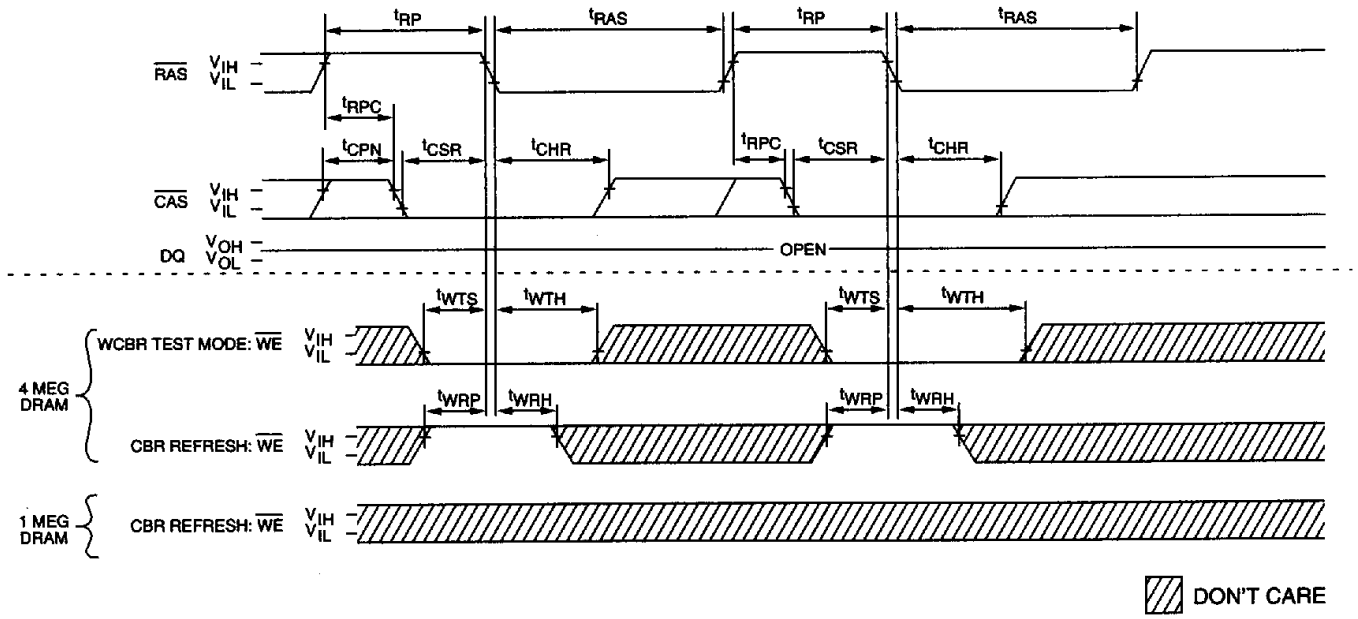
A CBR cycle with $\overline{WE}$ LOW will put the 4 Meg into the JEDEC-specified test mode (WCBR).

POWER-UP

The 4 Meg JEDEC test mode constraint may introduce another problem. The 1 Meg POWER-UP cycle requires a 100µs delay followed by any eight $\overline{RAS}$ cycles. The 4 Meg POWER-UP is more restrictive in that eight $\overline{RAS}$-ONLY REFRESH or CBR REFRESH ($\overline{WE}$ held HIGH) cycles must be used. The restriction is needed since the 4 Meg may power-up in the JEDEC-specified test mode and must exit out of the test mode. The only way to exit the 4 Meg JEDEC test mode is with either a $\overline{RAS}$-ONLY REFRESH cycle or a CBR REFRESH cycle ($\overline{WE}$ held HIGH).

SUMMARY

1. The 1 Meg CBR REFRESH allows the $\overline{WE}$ pin to be "don't care" while the 4 Meg CBR requires $\overline{WE}$ to be HIGH.
2. The eight $\overline{RAS}$ wake-up cycles on the 1 Meg may be any valid $\overline{RAS}$ cycle while the 4 Meg may only use $\overline{RAS}$-ONLY or CBR REFRESH cycles ($\overline{WE}$ held HIGH).



COMPARISON OF 4 MEG TEST MODE AND WCBR TO 1 MEG CBR
